and Other **6502** Systems

SPELUNKER BUT ONLY FOR THE BRAVE!

NO 17 **OCTOBER 1979** \$2.00

NOW PRESENTING..

Apple® software

for your Entertainment · Business · Education

Star Attractions:

FILEMASTER 2 programs: *FORMAT & RETRIEVAL* comprise a powerful data file manager. Great for everything from phone lists to legal abstracts. Needs 32K. Design your own data structure. Up to 500 characters per record. Up to 15 searchable fields in any combination. **On Disk. \$34.95**

SPACE Multi-faceted simulation of life in interstellar society. You and opponents must make life & death decisions. Keeps track of your progress from one game to next. Needs 48K and Applesoft ROM. **Disk \$29.95**

Pot O'Gold I or our All New Pot O' Gold II A collection of 49 programs for 16K Apple. Everything from Logic to action games. Only a buck a game. Specify I or II. Price each: **Tape \$49 Disk \$54**

ADVENTURE Fight off pirates and vicious dwarfs. 700 travel options, 140 locations, 64 objects. Needs ROM & 48K. **Disk. . \$29.95**

16K CASSETTE INVENTORY Use item number, description, stock amount, reorder amount, restock date, cost & sell price. Holds up to 140 items. **Tape \$35**

32K DISK INVENTORY: Use stock numbers description, vendor, record of purchase and sales date, amount on hand, cost & sell price, total value. Holds up to 300 items. **Disk \$40**

With Parts Explosion: Disk \$50

32K DATA BASE Cross file for phone lists, bibliographies, recipes. Run up to 9 lines of 40 columns each. Search by item anywhere. **Disk \$20**

24K HI-RES LIFE SIMULATION Conway's equations on 296x180 screen. A mathematical simulation to demo population growth with birth, death and survival as factors. **Tape \$10**

16K CIRCUIT LOGIC DEVELOPMENT AID Evaluate circuits of up to 255 gates, including AND, OR, NOR, NAND, XOR, XNOR and INVERTER. **Tape \$10**

16K MORSE CODE TRAINER Learn Morse Code, and transmit or receive over radio. **Tape \$10**

16K DEVIL'S DUNGEON: Adventure through dark passages where monsters, demons, poisonous gas, dropoffs threaten . . . all to discover fantastic treasures. Comes with instruction book. **Tape . . . \$10**

16K PACIFICA: Discover the floating island and rescue the beautiful princess. To win you must recover the enchanted crown, but you face the threat of magic spells and demons. **Tape. \$9.95**

Don't see what you've been looking for, here? Then write for our FREE SOFTWARE CATALOG. We're saving one just for you!

To order software, add \$2 shipping. To transfer tape versions to disk add \$5. California residents add 6% sales tax. Sorry, we can not ship to P. O. Boxes. **VISA/MASTERCARD** Welcomed!

RAINBOW'S CASINO 9 gambling games: Roulette, Blackjack, Craps, Horserace, and a few originals that Vegas hasn't heard about. Needs 16K. **Tape \$29.95**

16K SPACE WAR: You in your space capsule battle against the computer's saucer . . . in hi-res graphics. **Tape \$12**

16K MEMORY VERIFY Diagnostic routine to check range of memory. Indicates faulty addresses, data in memory cell, and faulty data. **Tape \$5**

16K APPLEODION Music synthesis composes original Irish jigs. Enter your own music and save on tape or disk. Includes 3 Bach fugues. **Tape. \$10**

16K APPLEVISION Demo for Hi-Res graphics and music. **Tape \$10**

32K COMPU-READ 5 programs to teach you speed reading, in stages. Includes synonym and antonym identification. You control your rate of speed, or keep up with the computer's pace. **Disk. \$24.95**

48K PERCEPTION I, II, III random shapes and sizes must be matched. In III, you control format and display time and get weighted scores. Needs ROM. **Each Disk. \$24.95**

32K STORY TELLER Use your bizarre imagination and input key words for fantastic and funny tales. Never the same story twice. **Tape \$12.95**

32K WAR/RESCUE Engage in 10 battles with your infantry against the Apple robots. Calculate Apple's strategy and win more battles than the computer. **Tape. \$12.95**

24K POLAR PLOT Plot polar equations in Hi-Res Graphics. **Tape \$10**

32K SHAPE SCALER Utility to generate and animate Hi-Res graphic shapes. Simple routine provided to inspect position of shapes, and specify precise X/Y coordinates and scale. Needs ROM. **Disk. \$13.95**

32K ZINTAR/PROPHET Great party game. Under control of the mighty Zintar's edict you take a very special trip to the world of Krintar. Heightened visual graphics. Needs ROM. **Disk \$16.95**

APPLE MONITOR PEELED Everything you wanted to know about the Apple Monitor but couldn't figure out. User-written manual in plain English clears your confusion. **Only \$9.95**

Garden Plaza Shopping Center, Dept. 11A

The Basic Switch™

Attention "Old" Pet™ Owners:

Not sure about the ROM Retrofit Kit from Commodore?
Now you can use **both** sets of Commodore ROMs and others as well.

The Basic Switch allows switch selection of **either** ROM set (your original set or your retrofit set) from Commodore. Plus, Model 15-A includes an additional zero insertion force socket allowing easy use of ROMs like the BASIC Programmer's Toolkit ... concurrently.

Model 14-E The economy model of **The Basic Switch**. Stand alone board and harness without case and case hardware. The free standing unit is ready to accept your ROMs.

Model 14-D Same as Model 14-E but includes attractive protective case and mounted **Basic Switch** board.

Note that Model 14 Series does not allow for expansion ROMs like the BASIC Programmer's Toolkit.

Model 15-A **The Basic Switch** plus ... includes expanded cable assembly and zero insertion force socket. Your 15th ROM simply plugs in ... enabled while either ROM set is selected. Socket 15 may be readdressed by the user for additional flexibility.

The Basic Switch is sold in assembled form only. All models are designed for easy attachment to your Pet with a convenient cable assembly. No soldering or drilling is required. **The Basic Switch** mates with a cable assembly at your primary board, and **does not use** the physical connectors of any Pet ports.

Model 15-A allows you to use the BASIC Programmer's Toolkit without the need for the additional \$25.00 board or tying up your ports. And since we've designed the 15th socket to be readdressable, watch for more ROM pacs later in the Fall.

The Basic Switch:		With installed ROM Retrofit Kit from Commodore:	With BASIC Programmer's Toolkit *
Model 14-E	\$64.95	\$149.95	—
Model 14-D	\$77.95	\$162.95	—
Model 15-A	\$99.95	\$184.95	\$149.95
Model 15-A with installed ROM Retrofit and BASIC Programmer's Toolkit:		\$229.95	

Model 15-A with installed ROM Retrofit and both Toolkits: \$274.95

"Old" Pets were shipped with 24 or 28 pin ROMs. You must check which you have, and specify at time of order.

The Basic Switch™ is a product of

Small System Services, Inc.

900 Spring Garden Street
Greensboro, North Carolina 27403

NEXT SUPER-TEXT

SUPER-TEXT is a professional word processing system for the Apple II and Apple II Plus computers.

SUPER-TEXT is the most innovative word processor available on any personal microcomputer and includes features previously found only on word processing systems costing thousands more!

An advanced multiple paging system allows you to view two text screens simultaneously. You may keep notes or instructions on one text screen while you edit on the other.

SUPER-TEXT is a character oriented editor with complete cursor controls to easily move the cursor to any position in the text with a minimum of keystrokes.

Built in floating point math and automatic tabbing facilitate the preparation of all manual reports including financial reports, insurance forms, real estate settlements and more.

SUPER-TEXT is easier to operate than a typewriter yet challenges the flexibility of pencil and paper.

SELECTED FEATURES:

EDITING - Full floating cursor. Cursor control - left, right, up, down or to center of screen. Add or insert a character, word or line. Automatic carriage return eliminates a word breaking at the end of the screen line. Delete a character, word, line or screen. Automatic on screen tabbing and right or left justification of columns. Unlimited text movement. Scroll either a page or a line forward or back. Move to the beginning or end of the text or screen. Move to the last change made in the text. Move to a block marker. Global search and replace (selective or all). Block operations - copy, delete or save to disk. Select multiple or single screen mode.

ADVANCED FILE HANDLING - Requires only two keystrokes to load or save a file to disk. The file name does not have to be entered which eliminates misspelling

and "FILE NOT FOUND" errors. Save entire text or portion of to disk. Complete file merging capabilities.

MATH - Automatic column totals. Formula computations. User selectable number of decimal positions. Automatically switches to scientific notation when necessary. 14 significant digits.

PRINT CONTROLS - Upper and lower case printing without additional hardware. Automatic paragraph indentation. Single or double space printing. Selectable right justification of text. Variable page length and width. Automatic page numbering. Selectable chapter-relative page numbering. Automatic print tabbing. Right or left justification of columnar data. Single sheet or continuous form printing. Superscripting and subscripting. Underscoring. Line centering. Automatic link and printing of multiple text files. (48k) 99.95

MICRO INFORMATION SYSTEMTM (48k) \$99.95 is a breakthrough in effective information systems of any size. This one system handles accounts payable/receivable, inventories, appointment calendars, cost estimating, real estate listings, sales solicitations, manpower accounting, selective mailings and label printing, dietary information, phone directories and more! On diskette

U-DRAW IITM (32k) \$39.95, a complete graphics package for the Apple II with disk. You can create a figure and rotate, expand, contract or move it anywhere on your video screen with a few simple keystrokes. Save individual figures or complete drawings on disk and recall them later. U-DRAW II automatically builds and edits multi-figure shape tables that are directly transferable to your BASIC programs. You won't find better graphics capabilities at 100 times the price!

APPILOT EDU-DISKTM (32k) \$49.95 A complete multi-program C.A.I. system for the APPLE II. Includes program editor and APPILOT interpreter on diskette with extensive on-line HELP lessons plus documentation manual

THREE MILE ISLANDTM (48k) \$39.95 Is the technology of a nuclear reactor too complex to handle? Now you have the opportunity to decide for yourself, with **THREE MILE ISLAND** a realistic simulation of a pressurized nuclear reactor. Four spectacular displays monitor the containment building, turbines, filters, condenser, reactor core and the pump house. Valves, pumps, turbines, filters and control rods are individually activated by keyboard command. The comprehensive documentation describes in detail the operating mechanisms and component interactions

SUPER-LOAD CASSETTES

U-DRAW (16k) \$17.95
ELECTRIC CRAYON (8k) \$17.95
MAZE GAME (8k) \$12.95
ESCAPE (16k) \$12.95
SIDE SHOWS (8k) \$12.95
TANK WAR (16k) \$12.95
MUSIC BOX (8k) \$12.95
BASEBALL (16k)* \$14.95
UNCLE SAM'S JIGSAW (32k)* \$12.95
GLOBAL WAR (32k)* \$17.95

*Plus APPLESOFT Board

Nicer Writer

Is screen wraparound a necessary fact of life? Or can the computer adapt to conventional line ending rules? This little BASIC output routine goes a long way toward eliminating wraparound once and for all.

Rick Connolly
41 Roland Drive
Bullwin, MO 63011

Has this ever happened to you: A group of friends are admiring your expensive investment. With the flair of a true computer expert, you press the appropriate buttons, push RETURN, and tell the expectant guests to watch the screen. "Hi!", the computer prints. "Thanks for answering the questions as well as you did, Rick. I can state that you should live 55.215677 more years and have 2.15662 children."

You wait for the applause. Instead, you hear, "How come the words run off the end of the line?" Dead silence. You are embarrassed—for your guests, of course. Instead of seeing the brilliant

output of your sophisticated program, your guests saw:

```
HI! THANKS FOR ANSWERING THE QUESTIONS AS WELL AS YOU DID, RICK. I CAN STATE THAT YOU SHOULD LIVE 55.215677 MORE YEARS AND HAVE 2.15662 CHILDREN.
```

Now, you and I know that screen wraparound is a fact of life. Perhaps the program concatenated a bit. Or, possibly, it was adapted from an article written by some thoughtless author with a 64 column screen or an 80 column printer. In either case, you probably will soon tire of explaining that nothing is

wrong with your magic machine; it just prints funny, sometimes.

This is the wrong approach! We don't adapt to the computer's idiosyncrasies; it adapts to ours. Right? The little subroutine at lines 35000 thru 35010 does a lot to help the wraparound problem. It is a human-oriented subroutine that prints on the screen using much the same rules we would use with a typewriter. Specifically,

It will break a line at a space, comma, period, colon, hyphen, or other character you specify.

If a word is longer than the allowable line, it will be hyphenated (rather arbitrarily, but this is a small subroutine).

At your pleasure, it will indent the first line of the output. This helps increase legibility.

Four variables control the output format. They may be entered once, at the beginning of a program, or they may be changed within the program if required. The variables used are:

- CW Column Width. This specifies the maximum columnar width of your output device, and is used for error catching.
- M1 Margin indent on the first line printed.
- M2 Margin indent on subsequent lines. (Note: Left justification

```

on the apple is HTAB 1, not HTAB 0).

M3 Length of the line you wanted printed.

N\$ N\$ is the dollar string you want nicely printed. You can form N\$ through concatenation, or can make it equal to another string developed within the program.

The word "Supercalifragalisticexpilidocious" (Does anyone really know how to spell it) is entered in the string N\$ of the sample run to point out two characteristics of the nice print subroutine. In the first nice print example, the length of the word has forced it down one line, leaving the preceeding line rather short. In the second example, where the word is longer than the allowable line length, super... is arbitrarily hyphenated. A short line should not appear too often with a 40 column line length, since most words are 10 letters or less in length.

Nicer writer is easy to incorporate into a program, and fast in execution. It will make your programs appear more professional and, best of all, it will keep your friends from asking questions like

```

35007 NEXT I. HTAB M2: PRINT LEFT$

MICRO

Disassembling the DOS 3.2

You "Can't tell the players without a score card" and you can not effectively use the Apple II DOS 3.2 without this important information on its organization.

William Reynolds
1733 N. Ford Street
McMinnville, OR 97128

On the surface, DOS 3.2 is identical to DOS 3.1. Upon booting, the DOS is loaded (slave or master), the greetings program is run, MAXFILES defaults to 3, and HIMEM is set at \$9600. DOS 3.2 still communicates with the rest of the APPLE via input and output hooks at \$36, 37, 38, and 39. (All addresses refer to a 48K machine.)

The differences are many: In Applesoft, DOS does the call 3314 or call 54514 automatically, volume checking is ignored unless explicitly defined in the command, and the system defaults to NOMON C,I,O status. The hooks at \$36 and 37 (the print routine) now contain \$9E81. The routine to restore DOS is now at \$9DBF. This can be called if page 3 is overwritten. The command and error message tables are in different locations. The command table is the same as in the DOS 3.1. The error messages, however, are quite different. After a BLOAD, A\$ is now found at \$AA72,3; L\$ is now found at \$AA60,1.

When the keyboard input routine (\$9E81), is called, DOS checks the mode. If it is in direct mode, the DOS reads the keyboard, then goes to the print routine. The print routine has seven routines of its own, 0-6. It calls the correct one, depending on whether the mode is direct, deferred, execute, read or write, etc. These routines are all inter-related.

In direct mode, when a return is detected, DOS attempts to match the string in the keyboard input buffer (\$200-2FF) to a command in the table. In

the print mode, direct or deferred, it stores all characters in the keyboard input buffer until a return is detected. It then checks for a CTRL-D as the first character. If not found, DOS drops out and returns control to wherever it came from. However, if Control D is detected, DOS attempts to match the string to the command table. If a match is not made, it prints "Syntax Error".

When DOS matches a command, it then checks for names, if needed, or numbers, if needed. After getting all data required, a check for optional data is made. After any optional data is read, numbers are changed to hex if need be, the maximum and minimum ranges are compared, then if all data is OK, the number is stored and DOS returns to check for any other optional data.

A routine gets the correct address from the stack, then executes the command. I have highlighted a few of the commands:

PR# and **IN#** do the same function as in BASIC, except that DOS will set the hooks properly before releasing control.

MON and **NOMON** set a mask at \$AA74 as follows: 0 = monitor nothing, \$10 = monitor 0, \$20 = monitor 1, \$40 = C, and combinations thereof.

MAXFILES resets HIMEM and PP (INT BASIC) and allocates a file buffer via a subroutine at \$A7D4.

BRUN does a BLOAD then a JMP (\$AA72).

RUN does a load, then jumps to a routine which executes the program.

Which routine is used is dependent upon which language is being used, BASIC, FP RAM, or FP ROM.

LOAD reads the file type and does either INT or FP as needed, then loads the program. When in FP mode, and after the program is loaded, DOS does the call 3314 or call 54514 as needed to set the program pointers for Applesoft.

FP attempts to find a ROM card and turn it on. If possible, it sets the return addresses via a routine at \$9D84. If no card is found, the DOS runs Applesoft, then goes to a routine at \$9DEA to set return addresses correctly.

INT makes certain the ROM card is off, then goes to \$9D84 to set return addresses correctly.

If a person wishes to use DOS from a language or operating system not standard to the APPLE, there is no problem, unless an error is detected. If you do not wish an error message to cause a return to BASIC or Applesoft, the address at \$9D5E and F can be changed for your particular system.

Whenever a change in language is done, DOS updates its return address stack from the stack for that particular language. All commands except PR#, IN#, MON, NOMON, INT, FP (if in ROM), and MAXFILES go through routines that use file buffers.

All commands may be called from monitor or machine language, provided (1) A language change is not needed, (2) the file names have been placed into the name buffer(s), and (3) that any other parameters have been properly placed into their locations as needed.

The disk controller card contains two (2) PROM's, 256 bytes each. One PROM contains the program to start the booting of the DOS. The other is used for a program that, together with some other IC's, actually controls the head position, reading a bit, writing a bit, sending the byte to the APPLE bus, and getting a byte from the APPLE bus. The following locations control the hardware functions. Add 00S0 to each address, S = the slot number of the controller card.

C080-87 These addresses sequentially step the motor that

moves the head back and forth. Odd addresses step one way, and even addresses step the other way.

C088 Turns off the drive motor.
C089 Turns on the drive motor.
C08A Enables drive two.
C08B Enables drive one.
C08C,D Control connecting the APPLE bus to the hardware for strobing the byte in or out of the 74LS323 IC shift register, depending upon the previously set status of C08E,F.
C08E,F Read/Write control.

I have documented all routines, sub-routines, buffers, and other locations to

the best of my ability in the memory maps that follow. Notes tell the function and usage of each. On most items I have given only the starting address. The end address is implied to be the next documented location minus one. On stacks of addresses, the parenthesized number is the number of addresses contained in that stack. Remember that any two-byte items are always stored low byte first. Documentation of addresses in the B000-BFFF area may be in error because that area got too complex for me to retain my sanity.

My thanks to my family for their time and patience, to other persons for their articles on DOS functions, APPLE for their excellent documentation, without which I would have had no idea what was going on, and to Terry and Kent at Computerland of Portland, for use of their printer to obtain 60 feet of hard copy, and their moral support.

APPLE II DOS 3.2 Memory Map

95FF	End of user RAM: HIMEM = 49151	9D00	Address of name of first file
9600	Start of data buffer	9D02	DOS keyin routine address
9700	Start of track and sector buffer	9D04	DOS print routine address
9800	Start of miscellaneous info buffer	9D06	Name number 1 buffer address
982D	Start of name of file	9D08	Name number 2 buffer address
984B,C	Address of start of miscellaneous info buffer (\$9800)	9D0A	
984D,E	Address of start of track and sector buffer (\$9700)	9D0C	Bottom of DOS
984F,0	Address of start of data buffer (\$9600)	9D0E	
9851,2	Address of start of name buffer, next file (\$0000 = no more files)	9D10	Address stack for the internal print routines (7)
9853	Data	9D1E	Address stack for the DOS command routines (28)
9953	Track and sector	9D56	Address stack for return to the current language (6)
9A53	Miscellaneous	9D62	Address stack for return to Integer BASIC
9A80	Name	9D6C	Address stack for return to Applesoft ROM (6)
9A9E,F	Address of start of miscellaneous info buffer (\$9A53)	9D78	Address stack for return to Applesoft Disk (6)
9AA0,1	Address of start of track and sector buffer (\$9953)	9D84	(3D3G) Control B, re-enters INT or FP (ROM only)
9AA2,3	Address of start of data buffer (\$9853)	9DBF	(3D0G) Restores DOS and re-enters current language
9AA4,5	Address of start of name buffer of next file down (\$982D)	9DEA	Restores \$3D0 - \$3FF from \$9E51 - \$9E80
9AA6	Data	9E51	Stack for the above routine
9BA6	Track and sector	9E81	Keyboard input routine
9CA6	Miscellaneous	9EBD	Calls correct internal print routine, depending upon mode
9CD3	Name	9ED1	Restores keyboard and print hooks
9CF1,2	Address of start of miscellaneous info buffer (\$9CA6)	9EEB	Internal routine for information from the disk
9CF3,4	Address of start of track and sector buffer (\$9BA6)	9F12	Internal routine for printing
9CF5,6	Address of start of data buffer (\$9AA6)	9F23	Prints and exits DOS
9CF7,8	Address of start of name buffer of next file down (\$9A80)	9F2F	Keyboard input internal routine
9CF9 - 9CFF	Unused	9F52	Internal routine for sending information to disk
		9F61	Routine to correct internal routine
		9F71	Used by the EXEC command
		9F83	Mask MON status, print and exit

9FC8	Does a RETURN	A74F	
9FCD	Start of section that attempts to match to a command and get all information needed and all optional information given. Checks syntax and ranges before execution.	A7C4	Checks file type
		A7D4	Sets up file buffers and addresses (used by MAX-FILES)
A229	PR# routine	A851	Restores DOS hooks
A22E	IN# routine	A884	Start of command table
A233	MON routine	A909	This is a table of two-byte masks. One byte is used to determine what type of extra data is needed by a command. The other byte is used by the hardware routines for what file type to create or look for.
A23D	NOMON routine		
A251	MAXFILES routine	A941	Table containing the letters V, D, S, L, R, B, A, C, I, O. This is used when checking for optional data.
A263	Start of DELETE routine	A94A	Table of bytes for determining what type of optional data to look for.
A271	Start of LOCK routine	A995	Table of minimum and maximum ranges for V, D, S, L, R, B, A.
A275	Start of UNLOCK routine	A971	Start of error message table
A27D	Start of VERIFY routine	AA3F	Relative address of start of error message, i.e. (\$A971,X)
A281	Start of RENAME routine	AA4F,50	Address of name section of next available file buffer
A298	Start of APPEND routine		
A2A3	Start of OPEN routine	AA51	
A2EA	Start of CLOSE routine	AA52	Internal print routine number
A331	BSAVE routine	AA53,4	PR# hooks out of DOS
A35D	BLOAD routine	AA55,6	IN# hooks out of DOS
A38E	BRUN routine	AA57	Number of total file buffers
A397	SAVE routine	AA58	Number of file buffers not in use
A413	LOAD routine	AA59 -	Temporary storage used by various routines
A4D1	Run routine		
A4E5	Runs Integer BASIC program	AA5E	Mask for MON and NOMON
A4F0	CHAIN routine	AA5F	Command number
A4FC	Runs FP ROM program	AA60 -	Found L\$ from a BLOAD
A506	Runs FP RAM program	61	
A510	WRITE routine (set up)	AA62 -	Temporary storage used by various routines
A51B	Read routine (set up)	65	
A54F	INIT routine	AA66,7	Defined volume number
A56E	Catalog routine	AA68,9	Defined drive number
A57A	FP routine	AA6A,B	Defined slot number
A59E	INT routine	AA6C,D	Defined length
A5C6	EXEC routine	AA6E,F	Defined record number
A5DD	Position routine	AA70,1	Defined byte number
A60E	Starts the read process	AA72,3	Defined address
A626	Starts the write process	AA74	
A644	Stores data coming from text file into keyboard buffer. Used by the EXEC command.	AA75	Start of file name buffer number 1
A65E	Error checking?	AA93	Start of file name buffer number 2
A679	Closes files, exits DOS	AAB1	
A682	Goes to hardware routines	AAB2	Control D
A69D	Sets up address of name section of next file	AAB3	Mode (direct, deferred, etc.)
A6AB	Close the buffer last used	AAB4,5	
A6C4	Prints, "SYNTAX ERROR "	AAB6	Value used for language, e.g. INT = 0, FP RAM = C0, FP ROM = 80
A6C8	Prints, "NO BUFFERS AVAILABLE"	AAB7	
A6CC	Prints, "PROGRAM TOO LARGE"	AAB8	The name, "Applesoft"
A6D0	Prints, "FILE TYPE MISMATCH"	AAC1,2	Address of start of IOB (used by RWTS)
A6D5	Prints other error messages by message number contained in \$AA5C	AAC3,4	Address of start of buffer for track/sector list (used by RWTS)
A71A	Moves parameters given to locations for use by hardware routines	AAC5,6	Address of start of buffer for data (used by RWTS)
A743	Moves name from the name buffer to the name section of the file buffer	AAC7,8	Top of total RAM in the APPLE II
A74E	Moves addresses of sections of file buffers to locations for use by hardware routines	AAC9	Address stack for hardware routines (14)
A764	Attempts to find a file buffer already in use by the name given	AAD5	Address stack for hardware routines (6)

AAF1	Address stack for hardware routines (6)		have been read and the subroutine is called again, it will merely exit with the carry set.
AAFD	Goes to the correct hardware routine	B037	Writes current directory sector from buffer to disk.
AB28	Reads VTOC and reads directory attempting to find an entry with the same name as the one given. If not found, checks the table of masks to see if it is allowed to create a file. If it may, it does so, and if not, it exits with "FILE NOT FOUND" or "LANGUAGE NOT AVAILABLE"	B052	Sets up IOB for directory sectors, goes to RWTS
		B0A0	End of above if no error
		B0A1	Start of error handling routine for above
ABDC	Clears miscellaneous info hardware buffer; sets volume number, drive number and slot number.	B0B6	Checks position in file, reads/writes next sector as needed
AC06	Close routine. Updates VTOC, track bit map, and sector count of directory entry as needed.	B134	Initializes data section of file buffer to all zeroes
AC3A	Rename routine. Finds directory entry, stores new name in entry, then writes that directory sector back to disk.	B15B	Sets next position in file
		B194	Increments position in file
		B1A2	Sets next RAM address
AC58	Goes to correct hardware routine	B1B5	Calculates how much RAM is left
AC70	Goes to correct hardware routine	B1C9	Reads VTOC and successive entries, attempting to find the specified file name.
AC87	Sets parameters for following routine	B21E	Puts name of file into directory
AC8A	Actually reads text file	B224	Sets next sector, updates VTOC buffer
AC93	Sets parameters for following routine	B2C3	Updates VTOC
AC96	Reads program or binary file	B2DD	Calculates track bit map for VTOC
ACA8	Puts byte being read into buffer	B300	Sets/checks parameters for file?
ACBB	Sets parameters for following routine	B35F	Routine with different entry points to exit the hardware routines with error
ACBE	Writes into text file		
ACC7	Sets parameters for following routine	B397 – A6	Temporary storage for hardware routines
ACCA	Writes program or binary file	B3A7 – AA	T, I, A, B Used by catalog for file types
ACDA	Gets byte being written from buffer	B3AB,C	
ACEF	Lock hardware routine	B3AD – BA	In reverse order, the string, "DISK VOLUME"
ACF6	Unlock hardware routine		
AD12	Sets parameters for following routine	B3BB	VTOC buffer
AD18	Verify hardware routine	B4BB	Directory buffer
AD2B	Delete hardware routine	B5BB – D0	Temporary storage for hardware routines
AD54	Part of delete routine, frees sectors used by deleted file.		
AD98	Catalog hardware routine	B5D1 – FF	Miscellaneous info section of currently used file
AE42	Part of catalog, prints the number in \$44 as three digit ASCII.	B600	Buffer. Purpose?
AE6A	Moves miscellaneous info from the file buffer to the hardware buffer.	B700	Reads drive 1, current slot, \$B1 sectors, track 0, sector A into RAM starting at \$1B00. Boot routine?
AE7E	Moves miscellaneous info from the file buffer to the hardware buffer.		
AE8E	Initialize hardware routine	B74A	Writes \$0A sectors, starting from \$B600, then \$1B sectors, starting at \$1B00, beginning at track 0 sector 0.
AF08	Sets 42 and 43 as pointers to sections of the file buffer		
AF1D	Writes data section of file buffer to disk	B793	Increments track/sector as needed and data address for above two routines
AF34	Writes track/sector list section of file buffer to disk	B7B5	Calls RWTS, checks status upon return
AF4B	Sets hardware pointer to the track and sector list section of the file buffer being used	B7C2	Sets address of data buffer, and sets expected volume number
AF5E	Checks position in file. If out of current sector, reads/writes next sector, updates VTOC buffer, updates track/sector list section of file buffer if in write mode.	B7DB	Stores zeroes in one page, starting at the address in \$42, 43
		B7E7	Start of IOB and device characteristics table
AFDC	Reads from disk into data section of file buffer	B800	Part of RWTS?
AFE4	Sets hardware pointers to data section of file buffer being used	BA90 – FF	Temporary storage for RWTS?
AFF7	Reads VTOC to its buffer (\$B3BB – B4BA)	BB00	One-page buffer (RWTS?)
AFFB	Writes VTOC from its buffer	BC00	One-page buffer (RWTS?)
B011	Reads a directory sector into its buffer (*B4BB – B5BA). Initially reads sector A, successive entries into this subroutine read successive sectors from the disk. When all sectors	BD00	Start of RWTS
		BFD4	End of RWTS
		BFD5	Various endings sections for the hardware routines
		BFFF	End of RAM

Hooking PET to Ma Bell

The dream of many microcomputerists to use their system as a terminal connected to a large computer system can become a practical reality. The \$50.00 hardware for any 6502 based system, and the software for a PET, are fully described.

C.H. Scanlon
P.O. Box 22
Arkansas State University
State University, AR 72467

Having worked with my 8K PET for almost a year, I have become hooked on microcomputers and am enjoying learning and experimenting with a great machine. Like most microcomputer enthusiasts, I dream of more memory, disks, printers, etc. However, attempting to raise a family on a teacher's pay means that I have limited funds. So I wired up a PET to RS-232 modem interface, plugged into a modem, and bingo — by dialing up the computer system on the campus of Arkansas State University, I have all of these plus

much more hooked to my PET. If you have telephone access to a computer system or a friend with an answer modem on his computer, here is the hardware and software to get you started communicating on the telephone.

The interface shown in Figure 1 can be built for under \$50 including connectors, wiring, etc., and can be plugged into any RS-232 modem (I have a U.S. Robotics Model 310 which lists for \$149). A TTL compatible modem can be wired

directly to pins 2 and 6 of the MC6850. All the parts, except the crystal, are fairly common and can be ordered from most mail order electronics parts firms. The 1.229 megaHertz crystal can be ordered from any crystal manufacturer for around \$10. This interface can be connected to any 6502 or 6800 based microcomputer that allows direct access to the microprocessor bus, for example, the APPLE, KIM, SYM, SWT, OSI, etc.

The software is written in BASIC and makes the PET act like a TTY type "dumb" terminal. The control characters are obtained by using the shift key. For example, control S is simply shift S. Although this program appears to limit the PET, it really doesn't since you can hit the stop key, write and run a program in the extra RAM and get back to the terminal program with a RUN 190 or a GOTO 190. For example, you could write a BASIC program starting at line number 500, compute a bunch of data, POKE the data to the modem, and then return to the terminal program with a GOTO 190.

Software

The MC6850 Asynchronous Communications Interface Adapter (or, in the buzz words of computerland, simply speak the letters A-C-I-A) is located in page B and has multiple addresses. I use hex BFF6 = 49142 as the address to POKE to the control register and to PEEK at the status register. Address BFF7 = 49143 is used to POKE a byte to the modem and to PEEK at a byte from the modem.

The BASIC program provides directions for the operator, data transfer from the modem to PET, data transfer from PET to the modem, and miscellaneous programming needs.

Lines 101 - 105 POKE a machine language routine into the second cassette buffer, and line 110 POKes the

```

NOTE: (cs) means clear screen and (cd) means cursor down.

Figure 2

PET MEMORY EXPANSION PORT

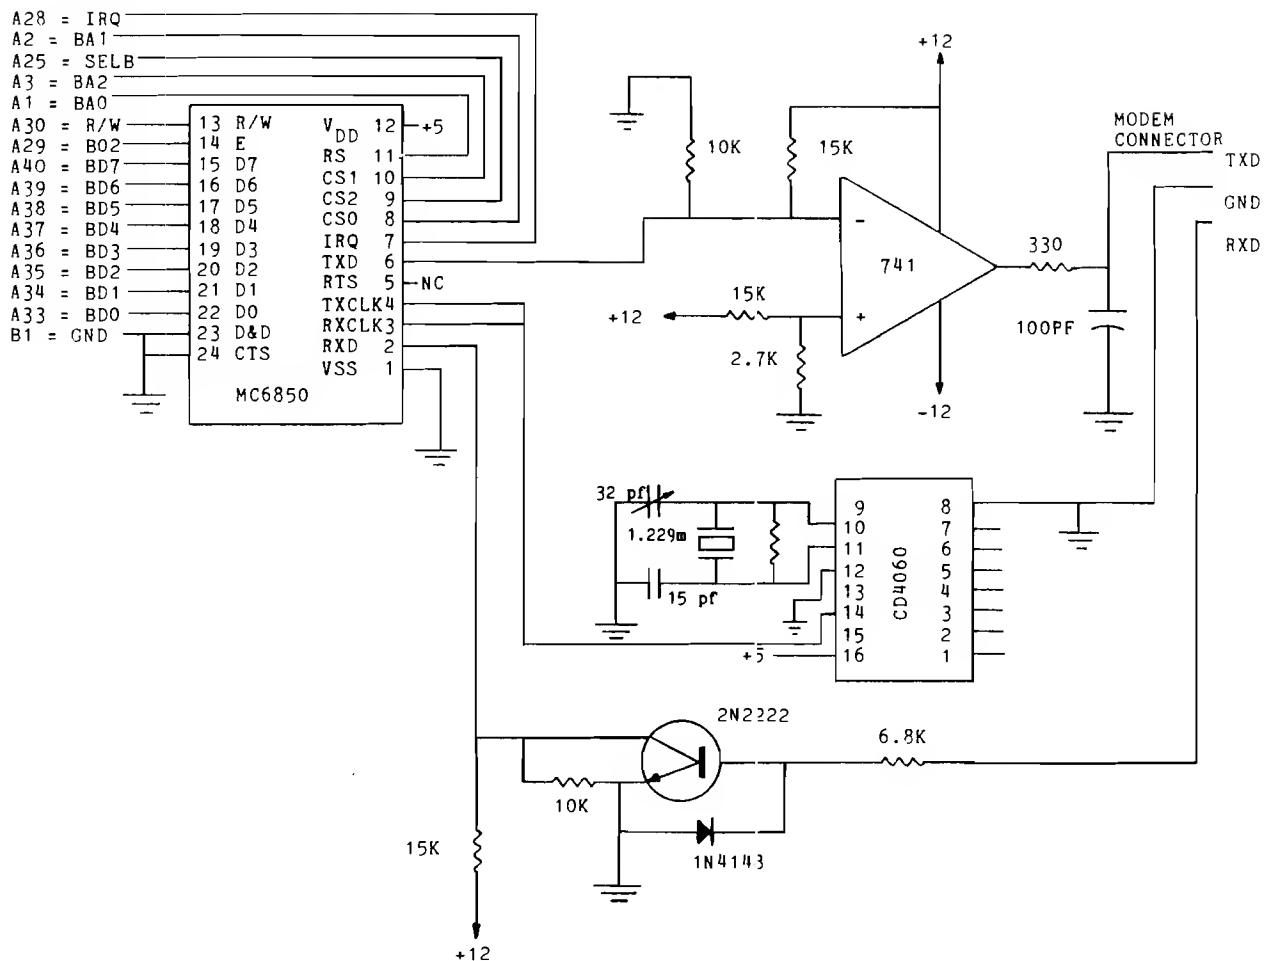

Figure 1

address of this routine into the interrupt address location of RAM so that, when an interrupt occurs, PET will check the ACIA before it checks the other possible interrupt locations.

When the ACIA receives a serial byte from the modem, it strips off the start and stop bits, converts it to parallel, and then interrupts the CPU. PET is then routed to the routine beginning at 033A.

Lines 033A - 033C transfer the contents of the ACIA status register, to register X and lines 033D - 033E cause a branch if bit 7 is set, indicating that the ACIA did interrupt the CPU and has a byte to transfer. Otherwise, lines 033F - 0341 transfer PET to the ROM interrupt sequence. Lines 0342 - 0344 transfer a data byte from the ACIA to register A and line 0345 clears the CPU interrupt to allow for other interrupts. Lines 0346 - 0347 strip the parity bit from the data byte and line 0348 transfers it to register X for temporary storage.

Next, to erase the cursor, lines 0349 - 034A load A with \$20 (note that CHR\$(32) is a blank). Lines 034B - 034D get the current position of the cursor on the video line and lines 034E - 034F then clear the cursor.

To type the character, line 0350 retrieves the data byte from register X and stores it in register A and lines 0351 - 0353, then types the character in the next print position.

To set the cursor, lines 0354 - 0355 load register A with \$A0 (note that CHR\$(160) = reverse blank), lines 0356 - 0358 get the current position of the cursor on the video line, and lines 0359 - 035A then set the cursor.

Lines 035B - 035D then transfer control back to the PET interrupt routine. Back in the BASIC program, line 115 POKES 3 into the ACIA control register which then resets the ACIA. Line 120 sets the lower case letter mode and then lines 120 - 180 print instructions and stop.

Since the answer modem at Arkansas State University uses seven bits plus parity plus two stop bits, line 190 programs the ACIA to transfer data in this mode. Reference 1 explains how to program other modes. Also, since the Arkansas State University computer initially waits for a control G, line 195 has a delay and then POKES a 7 = ASCII CTRL-G to the modem. Lines 200 - 300 then wait to get a character from the keyboard, convert the character to ASCII, and POKE it to the ACIA.

Hardware

The MC6850 is wired directly to the CPU bus through the memory expansion port. I use page B by wiring CS2 to SELB. Details of programming the ACIA can be found in reference 1.

The 1.229 megaHertz crystal and the C4060 counter put out a 4800 Hertz square wave to the ACIA. The ACIA further divides it by 16 to obtain a baud rate of 300. Reference 2 indicates how to get

other baud rates. The 741 op amp converts the RS-232 logic from the modem to TTL as described in reference 3.

You will need a ± 12 and +5 volt power supply. If you use a TTL compatible modem, you won't need the ± 12 volt supply and you can get +5 volts from the second cassette port.

Questions

There are lots of software questions I have not answered. For example, how can a program be copied directly from the cassette to the modem? How can a program or data file be "saved" by sending it to the storage facilities at the other end of the line and how can it be retrieved later? With the exception of displaying more characters, what can an expensive "smart" terminal do that PET can't do? As I stated earlier, this article is merely a start.

FORMAT

PROGRAMMA's FORMAT (Version 1.0) is a command oriented text processor designed to be fully compatible with PIE (PROGRAMMA Improved Editor).

FORMAT's system of imbedded commands (within the text) give it an ease of operation similar to text formatters found on some mini-computers.

FORMAT features right margin justification, centering, page numbering, and auto-paragraph indent.

The following commands are available with FORMAT:

- .ad Begin adjusting right margins
- .bp n Begin page numbered n
- .br Cause a line break
- .ce n Center next n lines without fil
- .fi Start filling output lines
- .fo t Foot title becomes t
- .he t Head title becomes t
- .in n Indent n spaces from left margin
- .li n Literal, next n lines are text
- .ll n Line length including indent is n
- .ls n Set line spacing to n
- .ml n Top spacing including head title
- .m2 n Spacing after heading title
- .m3 n Spacing before foot title
- .m4 n Bottom spacing including foot title
- .na Stop adjusting right margins
- .nf Stop filling output lines
- .pl n Page length is n lines
- .pp n Begin paragraph= .sp, .fi, .ti n
- .sp n Space down n lines, except at top
- .ti n Temporary indent of n
- .ul n Underline next n input lines

All orders include 3% postage and handling.

Spelunker

Spelunker is not for the faint of heart! It presents many interesting and useful programming techniques in the pleasant format of a game. As you play, keep telling yourself "It's only a game, it's only a game ..."

Thomas R. Milmitch
1547 Cunard Road
Columbus, OH 43227

This is an adventure fantasy series in which you become directly involved in exploration of a mysterious cavern in southwest Kentucky called Devils' Delve. If you have never played before, you should take a guide along. The guide will read the chamber descriptions as you enter each room for the first time. He can also supply some hints and clues to help you when you are stuck. Only the guide should use the room descriptions, word lists, and the map of the caverns. However, younger players may need some of these aids to help them.

Spelunker is an interactive game. You must converse with the program in order to explore the caverns and locate their treasures. You can talk in sentences, if you wish; but the program will use only one verb and one noun to establish meaning. For this reason, it is best to converse in verb/noun phrases. In the case of moving from chamber to chamber, for example, enter "GO W" or simply "W" and the verb "GO" will be implied. The Spelunker program will move you into the next room to the west upon receiving this command. Other examples might include "TAKE LIGHT" or "JUMP DOWN".

With this brief introduction you should be ready to explore the caverns of Spelunker. While you are about it, try drawing a map of the cave. You may also wish to discover exactly what vocabulary is understood by the program. The material that follows is for the guide only — so don't ruin your first adventure by peeking at it.

For the Guide Only

In the 16K APPLE II version of Spelunker, the chamber descriptions are not part of the program because of limited memory size. These room descriptions have been prepared for the adventurer's guide. The guide may read each room description as the adventurer enters the chamber for the first time.

1. **Mouth:** You are at the mouth of a large cavern. The sides of the entrance slope steeply upward, and a mysterious passage leads west into the cave.
2. **Tree room:** A towering, withered tree stands in what appears to be a dried up river bed. From it you seem to hear echoing sounds saying, "Water...water...water..."
3. **Writing room:** Do not read this description if the room is dark. The writing room is a large, oval chamber with tall ceilings and massive stalagmites. The smooth eastern wall has some writing on it — cryptic characters that spell out, "THE SPIRITS OF THE FRUIT."
4. **Pit room:** A small chamber with an immense stalagmite hanging from the center of the ceiling, directly over the mouth of a bottomless pit.
5. **South lake shore:** You stand at the edge of a misty lake that stretches endlessly out before you to the north.
6. **West lake shore:** You are standing on a damp, sandy shoreline with a very low passage leading off to the west. A clammy draft issues from the low-ceilinged passage.
7. **North lake shore:** A small, sandy beach on the northern edge of Misty Lake.
8. **Maze room:** Also known as the swiss cheese room. You loose your sense of direction because twisting passages are coming and going at all points of the compass.
9. **Frozen river room:** What appears to be a petrified river bed slopes gently upward leading toward the west. It has a low, four-foot ceiling.
10. **Swift river room:** You hear swiftly running water, as you enter this room, and you see a narrow, churning, underground river flowing to the south.
11. **Hub room:** A magnificently decorated chamber with crystalline designs and intricate rock formations. A narrow, fast moving river flows through the hub room.
12. **Ice room:** Mysteriously, ice forms very quickly in this chamber, encapsulating anything left there for too long. There is so much ice that you can't even get into the room; however, you see an exit on the other side of the chamber.
13. **Chimney room:** A small, smoke filled chamber with a fire burning in a natural fireplace in the north wall. Apparently, a chimney leads far up through the rock and out of the cavern.
14. **Gold room:** As you enter this room, the first thing that you notice is a pile of golden treasures nestled into a nook on the far side. Before you take another step, a foul-smelling ogre jumps out from a hole in the side wall and rushes forward to protect his gold.
15. **Bones room:** Lining the walls of this chamber are the skeletons of pirates long since dead. An ominous curse is uttered by all of the skeletons in unison, as you enter the room, and the curse shadows your travels throughout the cavern.
16. **Bat room:** The ceiling is all but invisible for the tens of thousands of bats sleeping there. In one corner of this room lies an old, rusted chest. As you open the chest, the bats begin to stir. Inside the chest is a king's ransom in jewels: diamonds, rubies and emeralds.
17. **Ghost room:** An eerie feeling of demonic power lurks in this chamber.
18. **Misty Lake:** You are in the middle of Misty Lake. A strange glow emanates from the bottom of the lake. You turn off your light and notice an enormous, bright pearl nestling inside a gigantic clam. The clam is at the bottom of the lake, in only ten feet of water.
19. **Swift River:** This narrow, fast flowing river is outside the cavern. It runs south for a few yards and then disappears underground.

Having been exposed to a fantasy program called *Adventure* which seems to reside on many large timesharing networks, I was challenged to see if this type of game could be handled on a micro. Thus the dream stage began. I thought up monsters, treasures, a cave structure, tools, tricks and battles. The major goals emerged:

Pseudo-English input commands (verb-noun phrases)

Interconnected rooms one could travel through

Objects one could take, put, carry and use

Monsters / treasures; do battle, take rewards

Secrets to be discovered

The obvious method was to tabularize as much data as possible so that similar functions could be implemented as subroutines. This left only special handling routines to be added.

The program was organized into five major sections. Lines numbered 30xxx initialize the tables and variables. Lines numbered 4xxx to 10xxx print out the current location and status for the player. Lines numbered 1xxx read and decode the input string. Lines in the 2xxx range perform the command action, if possible. In lines with 3xxx numbers the monsters have an opportunity to react to their environment. Each of these sections was developed,

tested and integrated separately from the others.

Input commands

A list of verbs and nouns was developed and categorized as to nature or function. After entering these tables into the program, I worked on the routine to read and decode input commands. Each word was picked out of the input string, then searched for in the noun and verb lists. The first recognized verb and noun numbers were the output of this routine, and this output controlled the action routines. I later added an edit to compare the noun type and verb type to see if they were compatible.

Table 1: Sample word tables for the guide.

The following lists of verbs and nouns are for use if you are having difficulty in communicating with Spelunker. Not all of these words have meaning or utility in this adventure. I didn't want to make it *too* easy!

VERBS

BITE	CARRY	CLIMB	DIG	DRINK	DRIVE
DROP	EAT	FIGHT	GO	HELP	HIT
JUMP	KILL	PUT	RUB	RUN	START
STOP	TAKE	THROW	USE	WALK	WISH

NOUNS

APPLE	AX	BATS	BOMB	BONES	CAVE
CHEST	CLAM	CURSE	DOWN	E	FIRE
GHOST	GOLD	ICE	KNIFE	LAKE	LAMP
LIGHT	N	NE	NW	OGRE	PEARL
RAFT	RIVER	ROPE	S	SE	SW
TENT	TREE	TRUCK	UP	W	WATER

Objects to take and put

Parallel to the noun list is the status list which gives the room number where an object currently resides. A -1 indicates that the object is in the possession of the player. In the output section, objects in the current room (LOC) were printed and the objects in the players possession were also reported. The second action routine was added next — the TAKE and PUT routine. TAKE changed the status of a noun to -1, while PUT set its status equal to LOC. Again I tested the program and played with it, moving things all over the caves.

Verb Table

		Sensative Noun Types						
Verb	Type	Direction	Location	Weapon	Monster	Treasure	Tools	Foods
1 GO	1	x						
2 JUMP	11	x	x		x			
3 RUN	1	x						
4 WALK	1	x						
5 DRIVE	1	x						
6 CLIMB	3	x	x					
7 DIG	2		x					
8 CARRY	116			x		x	x	x
9 DROP	116			x		x	x	x
10 PUT	116			x		x	x	x
11 TAKE	116			x		x	x	x
12 USE	36			x			x	
13 WISH	36			x			x	
14 THROW	4			x				
15 HELP	8							
16 KILL	8				x			
17 STOP	40					x		x
18 HIT	8					x		
19 FIGHT	8				x			
20 RUB	16					x		
21 START	32					x		
22 DRINK	64							x
23 EAT	64							x
24 BITE	64							x

Cave room structure

The map was finalized, giving each room a number. The interconnections were entered into the N, E, S and W arrays, with a positive number indicating an exit in that direction to the room number specified. A series of statements were inserted in order to print out the current room descriptions, but at the time only the room name was printed. Later I discovered that there was not enough memory to put in the complete descriptions in any event.

The first of the action routines — the MOVE routine — was coded next. If there was a possible move in the requested direction, the LOC variable was set to the new room and its description was printed. This portion was a lot of fun to test and debug.

Monsters, treasures and battles

The monsters and treasures were merely noun objects in the caves, like all of the other things. A relationship was defined between the monster, his treasure, the player, and the player's use of weapons. Thus grew up the monster table and the weapons table. The monster table identifies the monster, determines his strength, defines his treasure, identifies his home chamber, and determines how quickly he moves about the caves. The monsters move through the caverns to find their treasures if they are stolen. In the table are certain base probability factors for the monster to kill the player, steal all the player's treasures, or steal only the treasure than originally belonged to the monster.

The weapons table details the power of each of the player's weapons and determines which monsters they are effective against. The next action routine was ready to implement: the ATTACK routine. This is invoked whenever a weapon is used, put, thrown, and so on. Any monsters in the room are attacked, and their life forces are decreased by a random amount limited by the force of the weapon used. When a monster's life force is reduced to zero, it is eliminated.

Of course, it is not fair to let the player cut the demons to shreds without allowing them to fight back. Thus came the REACTION routines. Happy monsters are those that have their own treasures in their room and have not been attacked. Any monsters that are not happy will seek someone to vent their anger upon, and that person is the player. A very intricate set of probabilities decides the outcome of this anger. The more the monster has been hurt by the player's attacks, the weaker his counterattack will become. But also, the more times he has countered in vain, the madder he gets! Nothing is more deadly than a mad monster.

Noun Table

Noun	Type	Status (Location)
1 N	Direction	0
2 NE	Direction	0
3 E	Direction	0
4 SE	Direction	0
5 S	Direction	0
6 SW	Direction	0
7 W	Direction	0
8 NW	Direction	0
9 UP	Direction	0
10 DOWN	Direction	0
11 CAVE	Location	0
12 LAKE	Location	0
13 RIVER	Location	0
14 TREE	Location	0
15 AX	Weapon	4 = Pit
16 BOMB	Weapon	3 = Writing
17 CURSE	Weapon	15 = Bones
18 FIRE	Weapon	13 = Chimney
19 KNIFE	Weapon	1 = Mouth
20 CLAM	Monster	18 = Misty Lake
21 BATS	Monster	16 = Bat
22 BONES	Monster	15 = Bone
23 GHOST	Monster	17 = Ghost
24 OGRE	Monster	14 = Gold
25 CHEST	Treasure	16 = Bat
26 GOLD	Treasure	14 = Gold
27 PEARL	Treasure	18 = Misty Lake
28 LAMP	Treasure	12 = Ice
29 RAFT	Tool	5 = South Shore
30 ROPE	Tool	9 = Frozen River
31 TENT	Tool	1 = Mouth
32 TRUCK	Tool	1 = Mouth
33 LIGHT	Tool	1 = Mouth
34 WATER	Food	0
35 APPLE	Food	0
36 ICE	Water	12 = Ice

Room Table

Room	Tunnel Connects				Notes
	N	E	S	W	
1 Mouth	50		19	2	Truck Tent Knife Light
2 Tree		1	3		
3 Writing	2		10	20	Bomb
4 Pit		20			Ax Use rope to go down
5 South Lake Shore	-18				Raft-north Rope-up
6 West Lake Shore		-18		12	Raft-east
7 North Lake Shore	9		-18		Raft-south
8 Maze	8	9	8	20	All 45's return to Maze
9 Frozen River	7	1		8	Rope
10 Swift River Room	3		-11		Raft-south
11 Hub	13	14	-49	21	- 15 22 12 (NE SE SW NW)
12 Ice			11	6	Ice Lamp
13 Chimney			11		Fire Rope-up
14 Gold				11	Gold Ogre
15 Bones				11	Curse Bones
16 Bats	22				Chest Bats
17 Ghost		21			Ghost
18 Moosty Lake	7		5	6	Pearl Clam
19 Swift River	1				
20 Intersect 1	8	3		4	
21 Intersect 2		11	22	17	
22 Intersect 3	11		16	21	
49 Falls (Over)					Death
50 Home					End game

Lots of testing and refinements later, SPELUNKER took its maiden voyage. Surely a program like this is never finished. The framework has been laid for all

sorts of adventures, whatever one can imagine. And, now that I have more memory, I can expand the scope and capabilities of the program.

Program Flow

Initialize - 30000's

Dimension and set up data for nouns, verbs, noun types, verb types, status or location of nouns, north, south, east and west tunnel connections, monster life force tables, and weapons table.

Output - 4000's

Print room descriptions, possible exit directions, and room contents as well as your possessions.

Input/Decode - 1000's

Read your typed-in command, select each word and scan it against the noun and verb lists. The first valid noun and verb are edited and used to control the rest of the program.

Actions - 2000's

This routine handles takes and puts, special verbs and nouns, your attacks on life forces, and movement through the caverns.

Reactions - 3000's

The demonic life forces who have been attacked or who do not have their own treasures fight back. Based on complex probabilities, they either kill, steal your treasures, or wander the caverns in search of you.

Monster Table

Monster name	Ogre	Bats	Ghost	Clam	Ice	Bones
Monster number	24	21	23	20	36	22
Reward	Gold	Chest		Pearl	Lamp	
Reward number	26	25	0	27	28	0
Move delay	0	0	0	1	1	1
Move increment	2	4	6	0	0	0
Attack count	0	0	0	0	0	0
Kill probability	60	60	0	90	0	0
Steal all probability	30	40	0	60	60	0
Steal own probability	55	90	0	65	0	0
Home room number	14	16	17	18	12	15
Life force quotient	100	40	50	60	25	75

Weapon Table

Weapon name	Ax	Bomb	Fire	Knife	Light	Ice
Weapon Number	15	16	18	19	33	36
Power	100	150	30	50	30	40
Attacks Monster No. 1	24	24	21	24	23	21
Attacks Monster No. 2		22	22	20		
Attacks Monster No. 3		36	36			

Microbes

Move It: Relocating PET Source Programs and Object Code Herman, 16:17

The following table should have appeared with Harvey B. Herman's article in MICRO 16:17 MOVE IT ...

AIM-65 in the Ham Shack De Jong, 16:29

The following table should have appeared with Marvin L. De Jong's article. It is a table of ASCII to Morse code look-ups which is used by the "Ham Shack" program.

Operation	Comment
1. Load "MONITOR" and rewind	Sets up PET PARAMETERS
2. SYS 62894	Load tape header
3. SYS 1039	Run Monitor

The COMPUTERIST Has It All !!

The leaders in Expansion Accessories for
AIM / SYM / KIM

Featuring a Power Supply/Enclosure for the AIM 65

AIM PLUStm

ENCLOSURE

WITH BUILT IN
POWER SUPPLY

SPECIFICATIONS:

INPUT: 110/220 VAC 50/60 Hz

OUTPUT: +5V @ 5A

+24V @ 1A

GROUNDING THREE-WIRE LINE CORD

ON/OFF SWITCH WITH PILOT LIGHT

Enclosure has room for the AIM and one
additional board: MEMORY PLUS or VIDEO PLUS

Now with -
OVER-VOLTAGE and
SHORT-CIRCUIT
Protection

AIM ENCLOSURE:
\$45⁰⁰

AIM PLUS: \$110⁰⁰

AIM and AIM PLUS: \$485⁰⁰

Plus some very elegant expansion boards

MEMORY PLUStm

FOR

AIM/SYM/KIM

8K STATIC RAM LOW POWER

Sockets for 8K Eprom

6522 1/0 Port

ON BOARD REGULATORS

EPROM
PROGRAMMER

MEMORY PLUS: \$200⁰⁰

FULLY ASSEMBLED AND TESTED

VIDEO PLUStm

CHALLENGER IP OWNERS: Tired of 24X24 graphics? \$40 worth of components will upgrade your video display to give 30 lines X 50 characters on screen and double your processor speed. Complete software and step by step hardware modifications for only \$8.00. Contact:

S. Chalfin
905 Clinton St.
Philadelphia, PA 19107

PET LANGUAGE MACHINE GUIDE comprehensive manual to aid the machine language programmer. More than 30 routines are fully detailed so that the reader can put them to use immediately. Specify old or new ROMS. \$6.95 plus .75 for postage. Visa or Mastercharge accepted. Money back guarantee (10 days). Contact:

ABACUS SOFTWARE
P.O. Box 7211
Grand Rapids, MI 49510

WANTED Disk operating system, hardware and software for use with 16K SYM-1. Contact:

Kenneth A. Edelstein
341 West 71st Street
New York, NY 10023

SYM-1 OWNERS—SYM/KIM Appendix to First Book of KIM details changes to KIM games run on BASIC SYM-1. Changes shown line by line; load, modify, and run. Appendix only \$4. First Book of KIM \$9., combo both \$12.50 postpaid. Order from:

Robert A. Peck
P.O. Box 2231
Sunnyvale, CA 94087

For only \$33 for 12 issues you get **CURSOF**, the original magazine for the Commodore PET. Each issue has a graphic "Front Cover" program plus five excellent programs that are ready to Load and Run. The **CURSOF NOTES** newsletter with each issue provides useful information about the programs, as well as help on using your PET. Contact:

CURSOF
Box 550
Goleta, CA 93017

SUPER 8-K HORSE RACE: Up to ten people can go to the track and bet on 8 different horses each race. Every race is new, with graphics and sound. Best game of this type. On cassette for an 8K APPLE II for only \$9.95. Contact:

Tim Dowling
7243 Eastview Drive
Tucson, AZ 85710

APPLE, PET ATARI salespersons needed throughout the world. Work for commissions. Send resume to Recruiting Dept., **COMPUTERWORLD Inc.**, c/o Computer Components of Orange County 6791 Westminster Ave. Westminster, CA 92683

OPTIMIZE APPLESOFT programs: shorten variable names, remove remarks and extra colons, concatenate lines, renumber, list variable cross-references. (2) 1.3K programs for (16-48K) APPLE II's. Cassette \$15, disk \$20 from:

Sensible Software
P.O. Box 2395
Dearborn, MI 48123

NEW BOWLING PROGRAM FOR APPLE: One to four players compete in a standard bowling game. Challenging game with excellent quality **APPLESOFT** program. Cassette \$9.95. Order from:

C.E. Howerton
125 Marcella Road
Hampton, VA 23666

"STAR TREK" for your OSI Challenger IP or Superboard II, needs 5K RAM. Runs in machine language. Very fast and tough to beat. Send check or money order for \$12.95 to:

David Van't Hof
RR1
Hospers, IA 51238

Advertising Software for APPLE: \$25 buys **SCROLLING WONDER**, **GIANT LETTER**, and **HI-RES ALPHANUMERICS**; on cassette, 16kb. \$25 buys **MULTI MESSAGE** with **INTERLEAVED KALEIDOSCOPE**, and **MULTI MESSAGE** with **INTERLEAVED ABSTRACT ART**: on cassette, 32kb.

6522 Timing and Counting Techniques

While many 6502 computerists are becoming familiar with the 6522 Versatile Interface Adapter, do you really know how all of its features work or how to use them? This tutorial will clear up the mysteries of the 6522.

Marvin L. De Jong
Department of Math and Physics
The School of the Ozarks
Point Lookout, MO 65726

Applications that require interval timers include everything from the production of simple sound effects for games to the implementation of sophisticated data logging or control processes. Because single-chip microcomputers, such as the Rockwell 6500/1 and the Intel 8048, are intended for high volume, low cost applications, the fact that they include counter/timer logic is a testimony to the importance of counter/timer functions for a large variety of applications. Several simple applications will be explained.

The techniques will focus on the counter/timers found on the 6522 Versatile Interface Adapter. The 6522 is currently popular in a number of microcomputer systems that utilize the 6502, including the SYM-1, the AIM 65, and the MICRO PLUS. Expansion boards such as the MEMORY PLUS also include the 6522, and the 6522 can be easily interfaced to the popular KIM-1 (see *6502 User Notes*, No. 13, pg. 16). However, the techniques that are described will frequently be applicable to any

counter/timer with only minor modifications in the hardware or the programs.

The basic features included in many counter/timers (also called interval timers) are shown in Figure 1. This block diagram shows that a counter/timer consists of three registers; the counter register which is either an 8-bit register or a 16-bit register, a flag register, and a control register. A number, N, is loaded into the counter register by a WRITE (typically an STA) instruction. If the counter is a 16-bit register, then two write instructions are required. In 6502

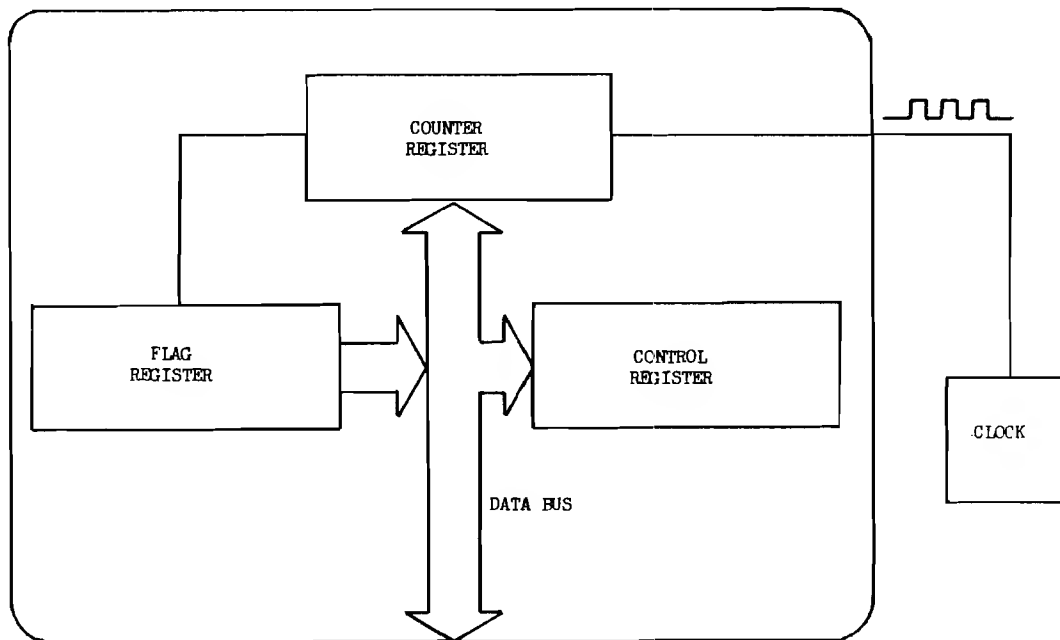

Figure 1. Block Diagram of a Typical Counter/Timer.

systems these registers are simply some of the 65536 memory locations. After N is loaded into the counter, it is decremented at a rate determined by the clock signal connected to the counter.

When N decrements *through* zero, one of the bits in the flag register is set to logic one. Thus, the contents of the counter register change as follows: N, N-1, N-2, ..., 2, 1, 0, and on the next clock cycle the flag is set. Consequently it actually takes N + 1 clock cycles to "time out." This summarizes the fundamentals of the counting/timing process.

The control register is used to select one of several modes available to the programmer. For example, in one mode the contents of the counter register are decremented at the same rate as the system clock, while in another mode pulses on an external pin cause the counter to decrement, and in a third mode the counter is automatically reloaded after each time-out. The modes available with a 6522 will be discussed in more detail below.

The 6522 Interval Timers

The 6522 Versatile Interface Adapter is a complex integrated circuit that includes two eight-bit I/O ports, four pins associated with handshaking signals for these two I/O ports, and two interval timers. The I/O ports and handshaking pins will only be of incidental interest, and we will describe the use of a few of these features as the need arises. Our principal interest is in the two counter/timers that are available on the 6522, called T1 and T2 respectively. Of course, the various registers needed to detect timing-out and to select the various timing modes will also be of interest.

In most 6502 microcomputer systems, the 6522 will be interfaced to occupy 16 contiguous memory locations. The AIM 65 and SYM-1, for example, use locations with addresses \$A000 to \$A00F for the 6522. Table I summarizes the names of each of these 16 locations, while Table II lists the functions of the registers. Of particular interest are the timer locations \$A004 through \$A009, the interrupt flag register (IFR), and the control register (ACR). These correspond precisely with the registers mentioned above in connection with Figure 1. That is, the IFR is the flag register and the ACR is the control register.

Both counter/timers, T1 and T2, on the 6522 are 16-bit devices; that is, a 16-bit number is loaded into the counter register and then decremented until time-out. Because the counter registers are 16-bit registers, two WRITE operations are needed to load the counter since only eight bits of data can be written at one time.

To prevent one eight-bit number (the low-order byte) from being decremented

while the other (the high-order byte) is still not loaded, temporary storage *latches* are provided. Using the T2 timer as an example, the low-order eight bits of the number, N, to be loaded into the counter are loaded into the low-order byte of the T2 latch (T2LL). Nothing happens. Next, the high-order eight bits of N are loaded into the high-order byte of the T2 counter. Referring to Table II, this last operation has three important and simultaneous consequences:

- The byte stored in the T2 latch (T2LL) is transferred to the low-order byte of the T2 counter (T2CL). T2 now contains a 16-bit number.
- The interrupt flag that signals the time-out, bit five of the IFR, is cleared (set to zero). It will be set (to one) when the number N decrements through zero.
- The countdown begins.

The T1 timer has two latches, one to store the low-order byte to be transferred to the counter, and one to store the high-order byte to be transferred to the counter. One reason for this difference is that the T1 timer has a "free-running" mode. At the end of one time-out, the two bytes of data stored in the latches are *automatically* transferred to the 16-bit T1 counter to start a new timing interval.

Furthermore, the values in the two latches may be changed during one timing interval to give a new value for the next interval. The examples that follow should make these points clear. Additional discussion of the READ operations outlined in Table II will also be postponed until required by a specific example.

A Simple Delay Loop Using the T2 Timer

The most common application of counter/timers is the implementation of delay loops. The counter/timer replaces a series of instructions that are designed to waste time. The counter/timer simplifies greatly the instructions that are necessary to program a time delay, and furthermore, the computer may execute other tasks during the delay produced by the timer, a feat that is much more difficult to perform with a software implemented delay loop.

An assembly language version of a simple delay loop using the T2 timer on the 6522 is listed in Table III. The mnemonics are perfectly general for 6502 systems, but the addresses of the registers of the 6522 are the ones given in Table II for the AIM 65 and the SYM-1. Programmers using other systems need only change the addresses to correspond to the locations of the 6522 registers in the address space of their

systems. Pay careful attention to the comments in Table III, because they relate each step to points in our previous discussion. Figure 2 is a flowchart of the delay loop, and it has a box for each of the instructions in Table III.

In the program listing given in Table III, timing begins at the completion of the STA T2CH instruction. The program waits in the loop consisting of the series of instructions LDA IFR, AND \$20, BEQ WAIT until the time-out of the T2 timer sets bit five of the interrupt flag register. The formula for the time T required for the interval timer to time-out is:

$$T = (N + 1)T_C$$

where N is the 16-bit number loaded into the counter and T_C is the clock period (typically one microsecond).

If the branch instructions (LDA IFR, AND \$20, BEQ WAIT) are taken into account, then the total loop time, T_L , is given by the expression:

$$(N + 6)T_C \leq T_L \leq (N + 14)T_C$$

The uncertainty of eight cycles in the loop time arises from the uncertainty of where the T2 counter/timer actually times out in the series of test and branch instructions within the loop. For the numbers that were used in Table III,

Table II. Memory Assignments and Functions of Some of the Registers of the 6522 VIA.

ADDRESS	SYMBOL	FUNCTION
\$A004	T1LL	WRITE (STA T1LL): Load an eight-bit number into the low-order byte of the T1 latch.
\$A004	T1CL	READ (LDA T1CL): Read the contents of the low-order byte of the T1 counter, and <u>clear</u> the interrupt flag, bit six of the IFR.
\$A005	T1LH	WRITE (STA T1LH): Load an eight-bit number into the high-order byte of the T1 latch, <u>transfer</u> the contents of both T1 latches to the T1 counters, <u>clear</u> the T1 interrupt flag, and <u>start</u> the counting process.
\$A005	T1CH	READ (LDA T1CH): Read the contents of the high-order byte of the T1 counter.
\$A006	T1LL	WRITE (STA T1LL): Load an eight-bit number into the low-order byte of the T1 latch.
\$A006	T1LL	READ (LDA T1LL): Read the contents of the low-order byte of the T1 latch.
\$A007	T1LH	WRITE (STA T1LH): Load an eight-bit number into the high-order byte of the T1 latch and clear the T1 interrupt flag.
\$A007	T1LH	READ (LDA T1LH): Read the contents of the high-order byte of the T1 latch.
\$A008	T2LL	WRITE (STA T2LL): Load an eight-bit number into the low-order byte of the T2 latch.
\$A008	T2CL	READ (LDA T2CL): Read the contents of the low-order byte of the T2 counter, and <u>clear</u> the interrupt flag, bit five of the IFR.
\$A009	T2CH	WRITE (STA T2CH): Load an eight-bit number into the high-order byte of the T2 counter, <u>transfer</u> the contents of the low-order byte in the T2 latch to the low-order byte of the T2 counter, <u>clear</u> the T2 interrupt flag, and <u>start</u> the counting process.
\$A009	T2CH	READ (LDA T2CH): Read the contents of the high-order byte of the T2 counter.
\$A00B	ACR	Bits five, six, and seven control the modes of T1 and T2.
\$A00D	IFR	Bit six equal to one signals a time-out of the T1 counter/timer. Bit five equal to one signals a time-out of the T2 counter/timer.

Figure 3. 60 Hz Signal Conditioner for the Low Overhead Clock. A circuit based on the 555 timer and using only the +5V supply can be found in Berlin's 555 Timer Applications Sourcebook, pgs.2-13.

$T = (\$C34E + 1)T_C = 0.05$ seconds for a one microsecond clock. The loop time is between 5 and 13 microseconds longer. For many applications, this uncertainty will be of no consequence.

As pointed out earlier, the microprocessor need not be idle while the timer is timing out. For the particular delay of 0.05 seconds programmed in Table III, a total of 50,000 clock cycles elapse while the timer is running. During that time, between 25,000 and 10,000 instructions could be executed by the 6502. These instructions would be placed between the STA T2CH and the

LDA IFR instructions. This is the principal advantage of the counter/timer implemented delay loop; that is, the microprocessor can be performing meaningful tasks during the timing-out process.

Counting Pulses — A 24-Hour Clock

The T2 timer can also be used to count pulses from an external source. This is useful for frequency counting (*MICRO*, June 1979, pg. 41) or any other event counting application such as radioactive half-life measurements. The T2 timer is placed in its pulse counting mode by setting bit five in the auxiliary

control register (ACR) to logic one, and applying the TTL level pulses to bit six of port B, PB6. To illustrate this mode, and to illustrate how the timers can be used to generate interrupt requests (IRQs), we have chosen to describe a simple 24-hour clock that requires very little computer time overhead.

The 60 Hz power line frequency is sufficiently stable over long periods for many clocks. Somewhere in your microcomputer system you will probably be able to locate a low-voltage 60 Hz source. This is conditioned by the circuit shown in Figure 3 to produce a 60 Hz square wave, and the output is applied to PB6 to be counted. Clearly there are 3600 (\$0E10) such pulses in a minute.

The T2 counter/timer will be programmed to count 3600 pulses followed by an interrupt request. The interrupt routine increments one location in memory to keep track of minutes, and when this location reaches 60, another location is incremented to keep track of the hours. At the beginning of the interrupt routine the T2 counter/timer is reloaded with 3600 for the next period.

The program is listed in Table IV. The first two instructions set bit five of the ACR to logic one. Next the timer is loaded with \$0E0F. Note that \$0E0F + 1 = 3600. The LDA \$A0 and STA IER instructions enable interrupts from bit five of the interrupt flag register (IFR) of the 6522 to the 6502 microprocessor's IRQ pin, a connection that is usually internal to the microcomputer system.

To enable interrupt request signals from T2, bit five of the IER (interrupt enable register) must be set to logic one, with bit seven of the IER also set to logic one. At the end of the timing interval, not only will bit five of the IFR be set to one, but also the IRQ pin on the 6502 microprocessor will be pulled to logic zero, producing an interrupt request.

The next instruction after enabling the interrupt from the T2 timer is the CLI instruction that allows the 6502 to recognize these interrupts. The last instruction in the main program should not be taken literally. It is simply an infinite loop that represents the user's main program, a FORTRAN interpreter for example.

The interrupt routine is also given in Table IV. Timekeeping routines have been described in several other articles (*MICRO*, March 1979, pg. 5), so the details will not be repeated here. Note that in order for the program to execute, the IRQ vector must point to the starting address of the interrupt request routine, in our case \$0300. Note also, that the program could be easily modified to keep track of seconds by counting only 60 pulses, something that can be done with an eight-bit counter like the one on the R650/1. The hours-minutes clock requires only about 50 microseconds per

minute of computing time, truly a low-overhead clock.

To display the minutes and hours, the user must provide a display routine that takes the contents of locations \$0000 and \$0001 and displays these numbers. Such a routine is not included in Table IV since the instructions used will depend on the microcomputer system, and previously written clock programs have included suitable display routines.

To summarize the operation of the T2 counter/timer on the 6522 we conclude this section with the following statements:

- To decrement the 16-bit number in the T2 counter at the system clock

rate, *clear* bit five of the ACR.

- To decrement the 16-bit number in the T2 counter using external pulses applied to PB7 (pin 6 of Port B), *set* bit five of the ACR.
- To produce an interrupt request (IRQ) when the counter decrements through zero in either of its modes, *set* bits five and seven of the IER.
- To disable the interrupt feature, *set* bit five of the IER and *clear* bit seven of the IER.
- A system RESET disables the pulse-counting mode and the interrupt request feature by clearing all the registers of the 6522.

Producing Long Time Delays

The maximum time delay that can be produced with the T2 counter/timer when it is decrementing at the system clock rate is approximately $(\$FFFF + 1)T_C$ or 0.065536 seconds if $T_C = 1$ microsecond. In certain applications longer time delays are necessary. To obtain these delays, the T1 timer is used in conjunction with the T2 counter/timer. We digress for a moment to introduce the T1 timer.

The T1 timer can be used to implement a simple delay loop in exactly the same way as the T2 timer. Refer to Table III. If the addresses \$A004 and \$A005 replace addresses \$A008 and \$A009, respectively, and if bit six of the interrupt flag register (IFR) is tested rather than bit five, then the program in Table III will work in exactly the same way except that the T1 timer is being used.

The same equation gives the loop time and, as in the case of the T2 timer, the maximum delay is about 0.065 seconds. The T1 timer cannot, however, count pulses. Consequently it cannot replace the T2 timer in the program listed in Table IV. In place of the pulse counting mode, the T1 timer has a free-running mode, and it is capable of toggling the logic level on pin seven of Port B, PB7.

The initialization of the free-running mode with PB7 toggling is illustrated in a simple program shown in Table V. This program will produce a square wave output on PB7. The period of the square wave is given by the equation:

$$T_p = 2(N + 2)T_C$$

where T_p is the period of the square wave, N is the 16-bit number loaded into the T1 timer, and T_C is the period of the system clock (typically one microsecond). The frequency of the square wave is $f = 1/T_p$.

To initialize this mode, bits seven and six of the auxiliary control register (ACR) must be set. Thus, the program in Table V begins by loading \$C0 into the ACR. Timing is initiated by loading the high-order byte of N into location \$A005 which corresponds to T1LH. Once started, the square wave will run forever, no matter what else is happening in the program, provided the registers that control the behavior of the T1 timer are not changed. That is, after the timer "times out", it will automatically reload the two counter registers from the numbers stored in its latches, T1LL and T1LH.

The last instruction in Table V is an infinite loop that simulates the user's program intended to run concurrently with generation of the square wave. Table VI lists some values for N that are frequently used in timing applications. If you have an oscilloscope, run the program with various values of N and connect the

APPLE II will change the way you think about computers. That's because it is specifically designed to handle the day to day tasks of education, financial planning, building security, scientific calculation, and entertainment. APPLE II is appealing and comfortable (like other appliances that make your life easier); and it brings to personal computing a new level of simplicity through hardware and software sophistication.

input of the oscilloscope to PB7 to monitor the square wave. You can use the program to calibrate your oscilloscope sweep time. If you have a frequency counter, measure the frequency of the square wave at PB7 to verify the equation, using the values for N given in Table VI. N is the number to be loaded into T1.

Note that the frequency of the square wave produced at PB7 by the program listed in Table V is as precise as the crystal oscillator frequency used for the system clock. This is because the square wave frequency is independent of any instruction length. The principal advantage of the free-running mode of the T1 timer is that the time between interrupt flag settings (or the frequency of the square wave on PB7) is independent of any instruction length. Thus, one can construct very precise time-keeping routines (*MICRO*, March 1979, pg. 5) or time measuring routines.

To produce simple delay loops for long time intervals, the pulses from PB7 are fed to PB6. Timer T1 operates in its free-running mode, and timer T2 operates in its pulse counting mode. Consequently, T2 counts the pulses produced by T1 on PB7. A program to produce a delay of one hour is given in Table VII. This program may be easily modified to produce delays of 1, 10, 60, 100, 1000, 10000, 36000, or 65536 seconds.

Timer T1 produces a square wave whose period is 0.1 second. These pulses are counted by the T2 counter/timer. If nine is loaded into T2, then 10 pulses, each of 0.1 second duration, will be counted, giving a delay of one second. Other time intervals are programmed accordingly. Of course, there is an uncertainty of several microseconds in the actual loop time, but this uncertainty will be unimportant for most applications.

If the program in Table VII is modified to allow T2 to produce interrupt requests (IRQs) by loading \$A0 into the interrupt enable register (IER) at location \$A00E (refer to Table IV), then it could be used in connection with the interrupt routine given in Table IV to produce a 24-hour clock program. To generate an interrupt every minute, as required by the low-overhead clock, T1 should count to 600. Load T1 with \$0257 instead of \$C39F as shown in Table VII and your clock should run. These modifications are shown in the AIM 65 disassembly format.

Sound Effects

The T1 timer can be used in its free-running mode to toggle PB7, and PB7 can be used to drive an amplifier. If the frequency is in the audible range, then a tone will be heard. A series of tones may make up a song. Table VIII lists the frequencies necessary to produce three oc-

Table VII. Program to Produce a One-Hour Delay.

taves of notes on the equally tempered scale (note middle A corresponds to 440 Hz and successive note frequencies are related by a factor equal to the 12th root of two). Also listed in Table VIII are the half periods in microseconds; that is, the numbers that must be loaded into the T1 timer to produce the notes. Since the period of the square wave is $(N + 2)T_C$, each of the numbers in the last column of Table VIII should be decremented by two.

A program to play songs using the notes in Table VIII is listed in Table IX. The identification numbers (I.D. numbers) of the notes in the song to be played are stored in a song table starting at \$0400. Actually, the song could be stored anywhere in memory that is convenient, simply by changing the base address of the song table. The base address of the song table is stored in \$0050 and \$0051, called SONG and SCING + 1, respectively.

The identification numbers (\$00 - \$23) found in the song table are used to index a note table found in page zero, from \$0000 to \$0047. The note table contains the half-periods of the frequencies found in the fourth column of Table VIII, corrected for the fact that the half-period is $(N + 2)T_C$ rather than $(N)T_C$. The low-order bytes of the half-periods are found from \$0000 to \$0023 in the note table, while the high-order bytes are found from \$0024 to \$0047.

The program first locates an identification number for a note from the song table. It then loads the latches on the T1 timer with the correct half period, and the note begins to play. The duration of the note is determined by a number found in the duration table, called DUR, and located from \$0800 upward. There must be one duration number for each note. The duration of a note is basically the number of times the T2 timer is allowed to time out. If \$01 represents a sixteenth note, then \$02 is an eighth note, \$04 is a quarter note, \$08 a half note, and \$10 a whole note. The tempo may be changed by changing the bytes loaded into the T2 timer at locations \$021E through \$0227 in the program listed in Table IX.

The song table given in Table IX simply plays the three octave scale from Table VIII with a variety of durations as indicated by the duration table. You are invited to make your own song or translate someone else's song into I.D. numbers. Better yet, write a song interpreter that does the translation for you.

Your interpreter should take a keyboard entry for a note and place the I.D. number into the song table. It should take another keyboard entry for the time value of the note and place it in the duration table. With several 6522s, you could play four-part harmony! With a D/A converter and a voltage controlled amplifier you could also control the note envelopes, giving an elementary synthesizer.

For my interface circuit, I used the 7404 inverter connected to PB7. The output from the 7404 was connected to one lead of a 1½ inch speaker and the other lead was connected to +5 volts. Better interfacing circuits to drive speakers have appeared in various articles and books (see Caxton Foster's *Programming a Microcomputer*).

Measuring the Time Between Events

A number of applications require that the time between two successive events be measured. The events might be the start and finish of a race, the arrival of cosmic rays, two heartbeats of an animal, and many others. If the events are periodic, then the time between events can be obtained by first measuring the frequency of the events with a

frequency counter and then applying the relation $T = 1/f$, where T is the time between successive events and f is the frequency of the events. For low frequency periodic events, such as a race, the only choice is to measure the time interval directly.

We will assume that the events produce positive pulses, and we will not try to describe how the positive pulses can be produced. Rather, our problem will be restricted to measuring the time between two successive positive pulses. A circuit and a program to accomplish this are shown in Figure 4 and Table X, respectively.

The circuit was inspired by Carlin's and Howard's article on the Intel 8253 in *Computer Design*, May 1979, pg. 213. The positive pulses clock a 7474 flip-flop, producing a logic-one voltage at the Q output of the 7474 for the time interval between the leading edges of the two pulses. With the T1 timer producing square waves on PB7, the logic-one voltage on the Q output gates the pulses to PB6 (by means of the 7400 NAND gate), where they are counted by the T2 counter/timer. For example, if a square wave whose frequency is 10 Hz ($T = 0.1$ second) is applied to the 7400 NAND gate, and 250 such pulses are counted on PB6, then the corresponding time interval is $(250)(0.1) = 25.0$ seconds, with a resolution of 0.1 second.

Clearly, no software is required to detect the pulses, and consequently very narrow pulses can be detected. Also, the programmer has control over the frequency of the square wave applied to the NAND gate. The resolution can be changed from 4.0 microseconds to 0.10 microseconds by varying the number loaded into T1.

Refer again to Table VI for a choice of frequencies for the free-running mode of the T1 timer that might be appropriate for a given application. Since the T2 timer is capable of counting to 65536, the maximum time interval that can be measured with a square wave whose period is T_p is:

$$T_{\max} = 65536(T_p) \\ = 65536(2)(N + 2)T_c$$

where T_{\max} is the maximum time interval that can be measured, T_p is the period of the square wave ($T_p = 1/f$) on PB7, N is the number loaded into T1, and T_c is the system clock period.

Refer again to Figure 4. When the second pulse occurs, the Q output of the 7474 flip-flop makes a transition to logic one. This also signals the conclusion of the timing interval. If Q is connected to CB1, the 6522 can be programmed to set a flag in the IFR when the logic-zero-to-logic-one transition on CB1 occurs. At this time the T2 counter/timer can be read, the result converted to decimal,

and the answer can be displayed or logged for the next set of pulses. All of this is accomplished with the routines given in Table X, a program that was designed to operate in conjunction with the circuit of Figure 4. An explanation of this program follows.

The largest number of pulses from PB7 that can be counted on pin PB6 by the T2 counter/timer is \$FFFF + 1 or 65536. Each memory location is capable of storing two BCD digits, thus three memory locations are required to store a number as large as 65536. These three memory locations have addresses \$0001 through \$0003 in the program shown in Table X, and they are used to store the decimal equivalent of the count made by the T2 counter/timer. The initialization steps, display registers cleared, flip-flop preset, timers loaded, control registers set, etc., require the first \$34 bytes in the program. After that, the interrupt flag register (IFR) is watched to see when a positive transition on CB1 occurs. When it does, a jump to the conversion subroutine, CNVD, occurs.

The function of the conversion subroutine is to convert the contents of the T2 counter/timer registers to an actual count in decimal. This count represents the number of periods of the square wave on PB7 that have occurred between the events being timed. The program in Table X uses a square wave whose period is 0.01 seconds, thus the

number of counts in T2 represents the number of hundredths of seconds that occurred between the two positive pulses on the clock input of the 7474 flip-flop.

The time between the leading edges of the positive pulses produced by the events (call this time T) as measured by the program in Table X is given by the formula:

$$T_m = T_p(\$FFFF - N_2) \\ = 2(N_1 + 2)(\$FFFF - N_2)t_c$$

where T_p is the period of the square wave on PB7, N_2 is the number in the T2 counter/timer at the conclusion of the timing interval, and N_1 is the number in the T1 timer. Refer to Table VI for the necessary N_1 to produce a suitable T_p . Values of T_p that are multiples of ten are most useful. The origin of the number \$FFFF in the equation lies in the fact that the T2 counter/timer is loaded with \$FFFF before timing begins. For the listing shown in Table X, T_p is 0.01 seconds, so the equation becomes:

$$T_m = 0.01(\$FFFF - N_2) \text{ seconds}$$

The precision with which one can measure the true time T between the events depends on the resolution, T_p , since clearly the true time need not be an exact integral number of T_p . Our analysis shows that the actual time, T, is given by the expression:

$$T_m - 1/2 T_p \leq T \leq T_m + 1/2 T_p$$

Thus, if greater precision is required, then T_p can be reduced.

The conversion subroutine, CNVD, performs the operation $(\$FFFF - N_2)$ shown in the equations. To get T, this number must be converted to decimal and then multiplied by T_p which, in our case, is 0.01 seconds. The hexadecimal to decimal conversion algorithm used in CNVD is from Peatman's book *Microcomputer Based Design*, while the coding used is from Butterfield's "Multi-Mode Adder" in *6502 User Notes*, No. 13, pg. 23.

Subroutine CNVD also calls a subroutine named AIMDSP. This routine displays the contents of locations with addresses \$0001, \$0002, and \$0003; namely those locations that contain the time T, now in decimal. No attempt has been made to locate the decimal point in these subroutines. As long as the period, T_p , of the square wave on PB7 is a multiple of ten, 0.01 second for example, the user should have no trouble placing his decimal point mentally.

In any case, subroutine AIMDSP is an AIM 65 dependent subroutine that has been published previously, so only its AIM 65 mini-disassembly format is given here. Owners of other microcomputer systems will want to substitute a suitable routine to display the contents

Figure 5. Stopwatch Interface for the Circuit in Figure 4. The switch is normally closed (N.C.). To produce a pulse when an event occurs, the normally open (N.O.) contact is closed momentarily.

of the three locations mentioned. Such routines for the KIM-1 and SYM-1 are readily available.

The time interval chosen for the listing in Table X is suitable for "stopwatch" functions, and a suitable stopwatch interface to the circuit of Figure 4 is given in Figure 5. This circuit simply debounces the switch when it is *momentarily* closed at the beginning and the

end of the interval to be timed. Phototransistor circuits can also be used to produce positive pulses when light beams are interrupted. A photoplethysmograph can be used to measure the time interval between heartbeats, turning the circuit of Figure 4 into a cardiometer.

One way to test the circuit of Figure 4 and the program in Table X is to apply a

square wave of known frequency to the clock input on the 7474. For example, if the pulses from the signal conditioner shown in Figure 3 are applied to the 7474, then the time interval should be 1/60 of a second. Since $1/60 = 0.01666$, and if $T_p = 0.0001$ second ($N_1 = \$0030$ from Table VI), then the number 1666 should be displayed for the time between successive positive pulses. Be sure to change the bytes at \$0221 and \$0226 to \$30 and \$00, respectively, in Table X if you make this test.

Finally, if an event can be made to produce a single positive pulse for its duration, the length of the event may be measured using a slightly modified form of the program in Table X and the circuit shown in Figure 6.

In conclusion I should like to point out that the programs and circuits given are the simplest ones I could construct. You will want to add more elegant features. The purpose of this article was to introduce a few basic techniques, not to present elaborate designs. If you come up with a neat design as a result of something you learned here, I would be very interested in getting a letter from you. Better yet, write up your circuit and program and publish both in *MICRO*. Although the circuits and programs described here were intended to be building blocks for more elaborate microprocessor based designs, the stopwatch interface and timing program could be used for "time and motion" studies around the house. Just make sure your spouse's motions do not make you lose track of the time!

Editor: Portions of this article are from Dr. De Jong's forthcoming book tentatively entitled 6502 Microcomputing, to be published by Howard W. Sams and Company, and scheduled for release later this autumn.

Complete with all hardware.
Interconnecting cables, FODS,
text editor and user and instal-
lation manuals.

The HDE DM816-MD1 Mini Disk System is the peripheral you have been waiting for. No longer bounded by long and unreliable cassette saves and loads, your computer becomes a sophisticated system for program development or general purpose use. With the HDE Mini-Disk you load and save programs in seconds, not minutes or hours. And, since all transfers to and from the Mini-Disk are verified for accuracy, the data will be there when you need it.

The HDE DM816-MD1 Mini-Disk has been "systems" engineered to provide a complete and integrated capability. Software and hardware have been built as a team using the most reliable components available. The systems software includes the acclaimed and proven HDE File Oriented Disk System and Text Editor, requiring only 8K for the operating software and overlay area. Systems expanding programs available include the

two-pass HDE assembler, the Text Output Processing System and Dynamic Debugging Tool. Hardware includes a Western Digital 1771 based controller in a state-of-the-art 4½ x 6½" card size, Shugart SA 400 drive and the Alpha power supply.

The storage media for the DM816-MD1 is the standard, soft sectored 5¼" mini diskette readily available at most computer stores, and HDE has designed the system so that the diskettes rotate only during disk transactions, favorably extending media life. A disk format routine included with the system, formats the diskettes, verifies media integrity by a comprehensive R/W test and checks drive RPM. Additional utilities provide ascending or descending alpha numeric sort, disk picking, text output formatting, file renaming, file addressing and other capabilities.

HDE PRODUCTS. BUILT TO BE USED WITH CONFIDENCE.

Card Shuffling Program for KIM - 1

Your 6502 might play poker like Amarillo KIM, but does it always have to pass the deal? Not if you teach it to shuffle cards!

Hark Chan
P.O. Box 714
Cambridge, MA 02139

Entertaining friends with computer games certainly makes all the effort of assembling a personal computer worthwhile. However, if you happen to have a small microcomputer with limited memory and very few software tools, there are not many games available. As an example, most card games need a random number generator to shuffle cards.

The standard method to generate random numbers (as used in most BASIC interpreters) is not suitable for this purpose. Since some of the bare-bone computers do not even have the software to perform multiplication, it is asking too much for them to generate floating-point random numbers. To make these small computers more entertaining, a simple method to shuffle cards is described here. This method is implemented in a KIM. The machine instructions use about 80 bytes. There is lots of memory left for playing card games. The only drawback is that it requires the operator to press the interrupt key in order to stop the program.

The card shuffling program consists of two portions. The second portion is the main program that shuffles cards. It just keeps on shuffling until the interrupt key is pressed. The first portion is an interrupt service routine used to ensure an orderly ending of the program. The program is relocatable, and the two portions can be in separate locations.

This feature makes it easy to incorporate the shuffling program into a complete card-playing program. However, it is important that the user initialize the interrupt vectors to jump to the interrupt service routine.

To keep the computer code relocatable, the initialization of the 2 byte address is left to the user. The storage area for the cards, together with 4 bytes of working space, are in page 0. In this program, the storage area starts at address 0001. However, the program can be changed easily to move the storage area to other locations in page 0.

The deck of cards is stored in an array at locations (hex) 0001 to 0034. The value of

each address is distinct and is between hex 1 to 34 (decimal 1 to 52). After the interrupt key is pressed, the content of these addresses represents a deck of random cards.

The program uses a simple random number generator to generate random pointers with values between 1 and 52. The first card in the deck is interchanged with the card selected by the random pointer. The position of all the cards is next shifted one place so that the last card becomes the first, the first card becomes the second, and so on. This is to make sure that the first card is always changing, and a different card is interchanged with each randomly selected card. A random pointer is again generated and the whole operation is repeated.

After a sufficient number of operations, the deck is suitable for card games. One or two hundred shufflings are sufficient.

When the interrupt key is pressed, the interrupt service routine sets a memory location, hex 0038, that serves as a flag to signal the end of the shuffling. This routine also restores the accumulator and the X and Y registers. It is important that the user initialize the interrupt vector to address the service routine instead of the operating system.

The sequence of cards being shuffled is actually predetermined because it is calculated from a prescribed series of operations. However, if the stop command is activated by a human operator the cards can be very random. It takes about 10^{-4} second to do one shuffle. The time to activate the stop command can easily vary by more than 0.1 second. Thus, the number of shufflings can be uncertain by about 1000, which is sufficient to generate a deck of random cards.

KIM/SYM/AIM-65—32K EXPANDABLE RAM

DYNAMIC RAM WITH ON BOARD TRANSPARENT REFRESH

THAT IS COMPATIBLE WITH KIM/SYM/AIM-65 AND OTHER 6502 BASED MICROCOMPUTERS.

- * PLUG COMPATIBLE WITH KIM/SYM/AIM-65. MAY BE CONNECTED TO PET USING A 40 PIN CABLE. SS44-E BUS EDGE CONNECTOR.
- * USES +5V ONLY (SUPPLIED FROM HOST COMPUTER BUS). 4 WATTS MAXIMUM.
- * BOARD ADDRESSABLE IN 4K BYTE BLOCKS WHICH CAN BE INDEPENDENTLY PLACED ON 4K BYTE BOUNDARIES ANYWHERE IN A 32K BYTE ADDRESS SPACE.
- * BUS BUFFERED WITH 1 LS TTL LOAD.
- * 200NSEC 4116 RAMS.
- * FULL DOCUMENTATION
- * ASSEMBLED AND TESTED BOARDS ARE GUARANTEED FOR ONE YEAR. / NO PURCHASE PRICE IS FULLY REFUNDABLE IF BOARD IS RETURNED UNDAMAGED WITHIN 14 DAYS.

How Do You Connect Peripherals to Your Superboard II

The OSI Superboard has a wealth of I/O ports, but often the effective use of them is "Left as an exercise for the reader". Here is some concise information on the configuration and use of the I/O ports.

Bruce Hoyt
Route 1
Brighton, TN 38011

Since I wrote "A Close Look at the Superboard II", *MICRO* 11:15, I have received several calls and letters asking for more information concerning interfacing the Superboard II to various peripherals — printers, memory boards and so on. Because of the continuing lack of information available from OSI, the manufacturer of the Superboard and the Challenger 1P, I have decided that it would be good to give some basic and rather general pointers on the use of the Superboard ports.

Since there are many different peripherals (understatement of the century) and since each one has its own requirements, I cannot be very specific about your particular device. Instead, I hope to describe the signals available on the Superboard in some detail, so that you will at least know something about its interfacing possibilities.

The J2 Port

There are four ports on the Superboard. Three of them are 12-pin Molex connectors and one of them is a 40-pin DIP socket. They are numbered J1 through J4. I shall begin with J2, since you are already using that one to interface your video monitor and your cassette. You will find a listing of the pin outs for J2 in Figure 1. Pins 7 through 10 are used for the cassette. Pins 11 and 12 are used for the video output.

I assume that you understand the basic use of these pins; and so, I will only mention that the signals generated for the cassette come from an on-board interface consisting of a Motorola 6850 ACIA and a couple of flip flops (U64). The audio input goes through an RCA 3130 which triggers a monostable one-shot and sets or resets a flip flop. This signal is then fed to the 6850.

The signals at the 6850 are designated as RxData and TxData. The 6850 also has two control signals which are not

used by the cassette interface but might be useful to your peripheral. They are designated as RTS and CTS on the schematics.

Finally, there are two separate clocks which drive the 6850: TxCLK and RxCLK. These clocks set the baud rate at which the 6850 operates. For precise information on the 6850, I suggest that you get a copy of the manufacturer's spec sheet on this ACIA. Your dealer should have it. I mention all of this simply because these six signals are present as TTL signals on J2, pins 1 through 6. If your peripheral requires TTL level serial data, then you will connect it to these pins.

But there is more to it than just connecting your peripheral's cable to the right pins on J2. My Superboard II came with several parts missing. You will need to install a 7417 at U68 and a 74LS14 at U67. You will also have to install the 220 and 390 ohm resistors at R38 through R49.

Next, notice that the RxData and CTS signals coming in on pins 1 and 3 respectively are called RxData3 and CTS3 after they come from U67. They are then routed to jumper locations W10 (the upper W10 to the right of Q2 in the schematic sheet 6) and W11. The reason for this is that you don't want input coming from two or three different sources going to the 6850.

I recommend that you install a DP3T (double pole three throw) switch so that you can switch the RxData line going to the 6850 between RxData1, which is the cassette input; RxData3, which is the TTL level input from J2; and the RS-232 input which will be described shortly. The other pole of this switch can be used to switch CTS appropriately. To install this switch you only have to cut the trace connecting the RxData line to RxData1 at W10.

With this switch installed, you can switch lines between three sources of in-

put: the cassette, your peripheral on TTL level lines at J2, and some other peripheral that uses RS-232 on J3.

One more change may be needed at jumper location W5, also on sheet six of the schematic. Here, the TxCLK is wired to the RxCLK. To separate them, you merely have to cut the diagonal trace connecting them and install another switch to switch the RxCLK line on the 6850 between the TxCLK line and the RxCLK input. I recommend, however, that you not make this modification unless you need separate clocks for your peripheral. If your peripheral is pretty stable and close to 300 baud, you can probably get by as is. But if you have a peripheral that has a clock rate different from 300 baud, you will need to make this modification.

You may now ask what the RTS and CTS signals are used for. If your peripheral is a printer, it may send out a busy signal whenever it is not ready to receive another character. This signal should be active high. It should be connected to the CTS on the 6850 — that is, it should be connected to J2 pin 3. You will have to switch W11 properly, since the CTS goes through this junction. You may also have a TTL line which controls the power on/off on your peripheral. Maybe you would like to control the cassette motor. You can do this with the RTS signal. It is a signal provided by the 6850 under software control; that is, your software, since OSI doesn't support this function.

Because it is fed through a 7417 buffer which is capable of sinking 30 milliamps, you can use it to drive a small reed relay. I purchased just such a relay, which operates on 5 volts at about 20 milliamps, and have used it to turn my cassette on and off. See Figure 2 for a schematic used to connect a relay to the RTS signal.

Now all the connections are made, but how do you instruct the computer to

transmit and receive these signals? Remember that the cassette is also connected to the 6850; and so, as far as software is concerned, the peripheral will work just like the cassette. Whatever you write to your cassette will go to the TxData line and to your peripheral. You read your peripheral just as you would read from the cassette (after you switch W10 over).

Let us suppose that you have a printer connected to the TxData line and that it sends a busy signal back over the CTS line when it is working. Whenever you give the command to "SAVE" in BASIC, this will activate the printer just as it does the cassette, so that any characters output by BASIC will be sent to both printer and cassette. If either of them is turned on, it will print or record the data sent. And how can one tell whether the printer is busy or not? You can't without writing some of your own software.

You see, Microsoft BASIC does not actually do any I/O; it merely jumps out to the I/O routine provided by OSI in the monitor. There are four routines that BASIC jumps to for I/O: one which inputs a character, one which outputs a character, one which is executed whenever the LOAD command is given, and one which is executed whenever the SAVE command is given. BASIC jumps to the following addresses which have instructions as shown:

Input	FFEB	JMPI	\$0218
Output	FFEE	JMPI	\$021A
Load	FFF4	JMPI	\$021E
Save	FFF7	JMPI	\$0220

The monitor stores the addresses of the input, output, load, and save routines at the locations \$0218, \$021A, \$021E, and \$0220 respectively every time the BREAK key is pressed. This makes BASIC transfer control to these routines when it needs I/O.

Of course, it would be easy to write your own routine and POKE the address of it in one of these locations so BASIC would then jump to your routine instead of the one in the monitor. You can disassemble the routines in the monitor, if you want to find out just what they do, but I will describe their functions here.

The input routine, located at \$FFBA, checks the load flag at \$0203. If it is zero, the routine jumps to the keyboard input routine at \$FD00 to input a character from the keyboard. If the flag is non-zero, the input routine checks to see if the spacebar is pressed and, if not, it inputs one character from the 6850 and returns. If the spacebar is pressed, it sets the load flag to zero and inputs a character (which will be a space since the spacebar is pressed) from the keyboard. This is why pressing the spacebar will stop reading from the cassette.

The output routine, located at \$FF69, jumps to the CRT simulator routine at \$BF2D which outputs a character to the screen and then checks the save flag at \$0205. If the save flag is 0 it returns. If the save flag is non-zero, it outputs the character to the 6850. If this character was a carriage return (that is, \$0D) then it also sends out 10 nulls (\$00).

The load routine, located at \$FF96, sets the save flag to 1. When you give the SAVE command, BASIC jumps to the save routine which sets the save flag. Then, whenever you output any character, BASIC jumps to the output routine which sends the character not only to the CRT, but also to the 6850. This will send it to the cassette and also to your printer. If you don't turn on your cassette, the character will only be printed by the printer.

But I still haven't described how you know when the printer is busy. You can PEEK at the 6850 control status register to see whether the CTS bit is low. Then you will know the printer is ready. But this is not a very good way to do it, since you would have to do such PEEKing prior to every print command! The better way is to write a short output routine which checks this bit for itself.

The 6850 occupies two address locations: \$F000 and \$F001. The first of these is the control register of the 6850 and, by writing and reading this address, one can send and receive control signals. \$F001 is the data register and, by writing or reading this address, one can send and receive data from the 6850.

The short output routine shown here illustrates how one might check for a printer busy signal. The listing includes two small programs that turn the RTS signal off and on. The latter might be employed to write a SAVE routine that could be called from BASIC and would turn the cassette or printer on automatically. Remember that you will have to put the addresses of your I/O routines in locations \$0218, \$021A, \$021E and \$0220 after each time you depress the BREAK key.

The J3 Port

The main purpose for J3 is to interface peripherals which require RS-232 signals. As can be seen in Figure 1, pins 2 and 3 are the data out and in pins. Pin 7 provides a negative voltage for the RS-232 interface. To use this, however, you will have to open the ground at jumper W10, the lower one under Q1. Even more than this, you will have to install all the hardware for the RS-232 signal level generation; that is, Q1 and Q2 and their associated resistors and diode. Once again you must set up W10 and W11 with the proper switch, as described previously, so that you can switch between the cassette and your peripheral. I believe that the description for J2 was sufficient to get you going on the software you might need to use this port.

The J4 Port

In the OSI manual on the Superboard, J4 is described as a "joystick" and "noise" port. The noise is made by turning on and off four of the keyboard

Figure 4

latches. These are coupled through resistors and a capacitor to pin 12 of J4. The main problem is that the resistors are not installed, nor are their values given. I have not experimented enough with these to determine what values would work best to give four bit analog output.

The main reason I have not done this experimentation is that I have not thought the "noise" would be very useful because it is coupled to the keyboard. For this reason, whenever the keyboard input routine is called, a tone is generated by a loop in that routine which sets and resets the keyboard latches.

If you wanted to produce some music, you could do so by choosing proper values for these resistors and then writing a small program to turn on and off these latches by writing to address \$DF00. I would advise installing a switch between the output of pin 12 and your amplifier since you will want to turn off this noise whenever you are not generating some music or gaming sound effects. The keyboard routine's continuous tone is rather annoying after a while!

If you want a beeper to signal various conditions audibly, then I recommend that you use the RTS output at J2. It comes from a heavy buffer which could be connected through a 100 ohm resistor and a small speaker to the 5 volt line. When this RTS signal is turned on and off at the proper rate, it would make a nice beeper without the need for the amplifier that the output at J4 pin 12 requires. Also, there would be no annoying continuous tone.

The other pins on J4 are quite useful because they are connected directly to the keyboard matrix. The graphics manual has a short description of how to deactivate the CTRL-C routine and how to check for a key depressed. If you were to connect lines 1 through 11 on J4 to some switches, you could use the procedure to determine whether the switches were closed. In this way, one might simulate a joystick.

By using four switches you could indicate eight directions. North, east, south and west could be indicated when exactly one switch was closed — the switch in that particular direction on your joystick. Northeast, southeast, southwest and northwest could be indicated by two adjacent switches being closed at the same time. By this means you could move a point on the screen in any of eight directions.

Another very good use for these lines would be to add a numeric keypad in parallel with the keyboard. To do so, you need only wire the switches on the keypad so they are in parallel with the corresponding keys on the keyboard as shown in the schematic, sheet 12. See

Figure 4 for a diagram of these switches. By doing this and writing a short BASIC program, you could imitate a very powerful calculator.

The J1 Port

This port is what OSI uses for expansion. It has all the data and address lines in addition to several of the control lines that the 6502 produces. I suggested in my previous article that this socket could be connected to a KIM type connector to make a KIM expansion port. That is more or less true but, as you will see from checking the signals available on J1 and the required signals on the KIM expansion port, there are a few missing. The most important ones are there, and it just may be that the ones you need to operate your peripheral memory board or whatever are present.

Pin 3, the DD line, needs some explanation. This line is an incoming signal that is used to control the data buffers U6 and U7. This line must be driven by the R/W signal, so I suggest that you connect both the R/W signal (that you get from U21 pin 6) and the line from J1 pin 3 to the R/W pin on the KIM expansion connector.

I think a 40 wire ribbon cable with a DIP plug on the end of it would be the best thing to make the connection from J1 to the KIM connector. Of course, some of the wires won't be useful; and so, you might be able to pull some of the unused wires out and solder them to the points on the Superboard where you are going to get the missing signals.

The missing signals can be found at the following places: R/W on U21 pin 6 as mentioned above, 02 on U21 pin 4, RST on the high (non-ground) side of the BREAK key, VCC where the red 5 volt supply line enters the board, VSS any place along the edge of the board where the ground plane is, SYNC on J8 pin 7, and 01 on U8 pin 3. If you need the RDY signal, you have to make a change on the Superboard. Open the short trace coming from U8 pin 2, which is the RDY line on the 6502, and put a 4.7K pull up resistor in the opening you have made. This will enable any peripheral that needs to use the RDY line to pull it low. After installing the resistor, you can wire the RDY line to U8 pin 2.

There are also R0, K6, SMT OUT, RAM/R/W, and PLL TEST lines on the KIM expansion connector, but you won't be able to get these from the Super-

board. I doubt that any of the peripherals you might be interested in will require them since they are rather peculiar to the KIM.

This method of directly wiring a KIM socket to the appropriate signals on the Superboard will give you a workable KIM expansion connector even though it may look a little messy since you have to run wires to several points on the Superboard. If you plan to use several boards simultaneously, you will want to make your connections to a KIM compatible motherboard.

You may ask if all this wiring is worth the effort, since OSI sells a 610 expander board which plugs directly into the J1 socket and which will then connect to the OSI 48-pin bus. I think that it is because I like to work with hardware and software together. OSI doesn't offer everything that I need, and their price is somewhat high for what I want. You may wish to investigate just what OSI offers in the way of peripherals before you make any of these changes and additions to your Superboard. In any case, I hope that you now understand a little more about how your Superboard works and how you might go about connecting some peripherals to it.

PYGMY PROGRAMMING

APPLE BUSINESS SOFTWARE

APPLE-DMS® 48k & disk required \$49.00

Apple data management system... the ultimate in free-form systems. You define the name and length of fields within each record. Multi disk capability gives you access to thousands of records at once with the included sort/edit features! The print format is also defined by the user for custom report generation. Uses include mailing labels, inventory, personnel data and other record keeping functions.

APPLE-SCRIBE-2® disk or cassette \$49.00

Text processor... the perfect addition to any business system. This is a non-line oriented editor that allows upper and lower case letters, any width paper and any length page. Included features are automatic headings, date and page number, right hand justification, search with universal or individual replacements. Text is stored on disk or cassette for easy retrieval.

WE'VE GOT YOUR COMPUTER

C1P: \$349! A dramatic breakthrough in price and performance. Features OSI's ultra-fast BASIC-in-ROM, full graphics display capability, and large library of software on cassette and disk, including entertainment programs, personal finance, small business, and home applications. It's a complete programmable computer system ready to go. Just plug-in a video monitor or TV through an RF converter, and be up and running. 15K total memory including 8K BASIC and 4K RAM — expandable to 8K.

C1P MF: \$995! First floppy disk based computer for under \$1000! Same great features as the C1P plus more memory and instant program and data retrieval. Can be expanded to 32K static RAM and a second mini-floppy. It also supports a printer, modem, real time clock, and AC remote interface, as well as OS-65D V3.0 development disk operating system.

C2-4P: \$598! The professional portable that has over 3-times the display capability of 1P's. Features 32 x 64 character display capability, graphics, full computer type keyboard, audio cassette port, and 4 slot BUS (only two used in base machine). It has 8K BASIC, 4K RAM, and can be expanded to 32K RAM, dual mini-floppies and a printer.

C2-4P MF: \$1533! It's a big personal computing mini-floppy system at a special package price. Contains the famous C2-4P microcomputer with 20K static RAM, 5" mini-floppy unit for instant program and data loading, RS-232 circuitry (for optional modem and printer), and diskettes featuring exciting games, personal, business and education applications.

C2-8P DF: \$2599! A full business system available at a personal computer price! The system includes the powerful C2-8P microcomputer (32K RAM expandable to 48K), dual 8" floppy unit (stores 8-times as much information as a mini-floppy), and 3 disks of personal, educational and small business applications software. Has all the capabilities of a personal system including graphics plus the ability to perform Accounting, Information Management, and Word Processing tasks for small business.

C2-8P: \$799! The personal class computer that can be expanded to a full business system. Has all the features of the C2-4P plus an 8 slot BUS (3-times greater expansion ability than the C2-4P). Can be expanded to 48K RAM, dual floppies, hard disk, printer and business software.

I'm interested in OSI Computers. Send me information on:

PROGRESSIVE SOFTWARE

Presents Software and Hardware for your APPLE

SALES FORECAST provides the best forecast using the four most popular forecasting techniques: linear regression, log trend, power curve trend, and exponential smoothing. Neil D. Lipson's program uses artificial intelligence to determine the best fit and displays all results for manual intervention. **\$9.95**

CURVE FIT accepts any number of data points, distributed in any fashion, and fits a curve to the set of points using log curve fit, exponential curve fit, least squares, or a power curve fit. It will compute the best fit or employ a specific type of fit, and display a graph of the result. By Dave Garson. **\$9.95**

PERPETUAL CALENDAR may be used with or without a printer. Apart from the usual calendar functions, it computes the number of days between any two dates and displays successive months in response to a single keystroke. Written by Ed Hanley. **\$9.95**

STARWARS is Bob Bishop's version of the original and best game of intergalactic combat. You fire on the invader after aligning his fighter in your crosshairs. This is a high resolution game, in full color, that uses the paddles. **\$9.95**

ROCKET PILOT is an exciting game that simulates blasting off in a rocket ship. The rocket actually accelerates you up and over a mountain; but if you are not careful, you will run out of sky. Bob Bishop's program changes the contour of the land every time you play the game. **\$9.95**

SPACE MAZE puts you in control of a rocket ship that you must steer out of a maze using paddles or a joystick. It is a real challenge, designed by Bob Bishop using high resolution graphics and full color. **\$9.95**

MISSILE ANTI-MISSILE displays a target on the screen and a three dimensional map of the United States. A hostile submarine appears and launches a pre-emptive nuclear attack controlled by paddle 1. As soon as the hostile missile is fired, the U.S. launches its anti-missile controlled by paddle 0. Dave Moteles' program offers high resolution and many levels of play. **\$9.95**

MORSE CODE helps you learn telegraphy by entering letters, words or sentences, in English, which are plotted on the screen using dots and dashes. Ed Hanley's program also generates sounds to match the screen display, at several transmission speed levels. **\$9.95**

POLAR COORDINATE PLOT is a high resolution graphics routine that displays five classic polar plots and also permits the operator to enter his own equation. Dave Moteles' program will plot the equation on a scaled grid and then flash a table of data points required to construct a similar plot on paper. **\$9.95**

UTILITY PACK 1 combines four versatile programs by Vince Corsetti, for any memory configuration.

POSTAGE AND HANDLING

Please add \$1.00 for the first item
and \$.50 for each additional item.

- Programs accepted for publication
- Highest royalty paid

U.S. and foreign dealer and distributor inquiries invited

All programs require 16K memory unless specified

- **Integer to Applesoft conversion:** Encounter only those syntax errors unique to Applesoft after using this program to convert any Integer BASIC source.
- **Disk Append:** Merge any two Integer BASIC sources into a single program on disk.
- **Integer BASIC copy:** Replicate an Integer BASIC program from one disk to another, as often as required, with a single keystroke.
- **Applesoft Update:** Modify Applesoft on the disk to eliminate the heading always produced when it is first run.
- **Binary Copy:** Automatically determines the length and starting address of a program while copying its binary file from one disk to another in response to a single keystroke. **\$9.95**

BLOCKADE lets two players compete by building walls to obstruct each other. An exciting game written in Integer BASIC by Vince Corsetti. **\$9.95**

TABLE GENERATOR forms shape tables with ease from directional vectors and adds additional information such as starting address, length and position of each shape. Murray Summers' Applesoft program will save the shape table anywhere in usable memory. **\$9.95**

OTHELLO may be played by one or two players and is similar to chess in strategy. Once a piece has been played, its color may be reversed many times, and there are also sudden reverses of luck. You can win with a single move. Vince Corsetti's program does all the work of keeping board details and flipping pieces. **\$9.95**

SINGLE DRIVE COPY is a special utility program, written by Vince Corsetti in Integer BASIC, that will copy a diskette using only one drive. It is supplied on tape and should be loaded onto a diskette. It automatically adjusts for APPLE memory size and should be used with DOS 3.2. **\$19.95**

SAUCER INVASION lets you defend the empire by shooting down a flying saucer. You control your position with the paddle while firing your missile at the invader. Written by Bob Bishop. **\$9.95**

HARDWARE

LIGHT PEN with seven supporting routines. The light meter takes intensity readings every fraction of a second from 0 to 588. The light graph generates a display of light intensity on the screen. The light pen connects points that have been drawn on the screen, in low or high resolution, and displays their coordinates. A special utility displays any number of points on the screen, for use in menu selection or games, and selects a point when the light pen touches it. The package includes a light pen calculator and light pen TIC TAC TOE. Neil D. Lipson's programs use artificial intelligence and are not confused by outside light. The hi-res light pen, only, requires 48K and ROM card. **\$34.95**

TO ORDER

The MICRO Software Catalog: XIII

Mike Rowe
P.O. Box 6502
Chelmsford, MA 01824

Name: **Text Processing System** (Editor and Assembler)
System: **APPLE II**
Memory: **24K**
Language: **Integer BASIC and Machine Language**
Hardware: **APPLE II, 24K and Disk II**

Description: This disk based system allows you to create and edit Applesoft, Integer BASIC, assembly language, and APPLE DOS exec files. The text editor provides capabilities to create, load, modify and save APPLE II disk operating system text files. Editing features include simple-to-use data entry, extensive character and string searches and replacement, block line movement, and simple single line macros. Text creation and modification is further simplified with such features as tabbing, specific search windows, file merging, and line deletion. The text editor supports systems equipped with a printer to create permanent listings of text files.

The assembler is a complete, disk-based, two pass symbolic assembler. You can assemble up to ten disk based text files at any one time. The assembler will generate disk based binary files that can be executed via the APPLE DOS "BLOAD" or "BRUN" commands. Eight character symbols allow for meaningful variable and routine names. The assembler supports all 56 standard 6502 opcodes and six additional pseudo-opcodes used to define constants, labels, program addresses, etc. Meaningful error messages are generated to help locate program mistakes. The assembler can generate both program and symbol table listings, with optional line printer output.

Copies: **200**

Price: **\$55.00 plus \$1.00** shipping and handling

California residents add 6 per cent sales tax

Includes: All programs on a diskette and a complete 60-page user's manual.

Author: **Jeffrey Gold**

Available from:

Software Concepts
Box 1112
Cupertino, CA 95014

Name: **Household Finance Program**
System: **APPLE II**
Memory: **32K**
Language: **Integer BASIC and Machine Language**
Hardware: **APPLE II, 32K, and Disk II**

Description: The household finance program is a comprehensive household record maintenance and budget management program. This disk based system provides the capability to maintain 175 records a month for 12 months (that's over 2000 records on a single diskette). With a simple to use data entry mode, a user can enter check transactions, deposits, and cash expenditures.

Error correcting is a simple matter with a complete set of editing features. Twelve user definable budget categories are available to allow a family to plan and analyze spending patterns. Check and cash expenditures can be assigned to any budget category. Both month-to-date and year-to-date budget summaries are available. Additionally, the program will provide data on how well the family is keeping to its established monthly budgets. Previously entered financial records can be retrieved via a comprehensive data listing mode.

Other program features include checkbook balancing, tax deductible classification, and single disk drive copy (backup) to protect against data loss. The program supports systems equipped with a printer and can provide user selected permanent listing via a unique page print mode. This software package is the most complete, easy-to-use home financial program available today.

Copies: **20**

Price: **\$39.95 plus \$1.00** postage and handling

Includes: All software supplied on a program diskette with a complete 32-page user's manual.

Author: **Jeffrey Gold**

Available from:

Software Concepts
Box 1112
Cupertino, CA 95014

Name: **Belais' Master Index to Computer Programs in BASIC**

System: **All**

Memory: **N/A**

Language: **BASIC** (a few programs require machine language routines)

Hardware: **N/A**

Description: A directory of computer programs written in BASIC. The programs are ones that have appeared in ten major home computer magazines. They cover both business and personal applications. All major computer systems are included. Many of the programs are written specifically to take advantage of the capabilities of such 6502-based computers as the PET and the APPLE II. The reviews provide detailed information about what each program does, and what hardware and software it needs. Program listings are *not* provided, but information is given on where to get them.

Price: **\$9.95** plus **\$1.00** shipping

California residents must include 6 per cent sales tax.

Includes: Book

Order info: VISA/Master Charge accepted (give account number, expiration date, and signature).

Available from:

Falcon Publishing

Dept. Y

P.O. Box 688

Ben Lomond, CA 95005

Name: **Mailing List Program**

Memory: **48K** with DOS and Applesoft ROM

Language: **Applesoft II**

Hardware: **APPLE II, disk drive, printer**

Description: The mailing list program is a disk based, menu driven program written in Applesoft II. In order to use the program, a 48K system with Applesoft II on firmware along with one disk drive and DOS 3.2 is required. If your system does not have Applesoft II on firmware, the mailing list program can still be used but the number of entries will be greatly reduced.

The program is able to maintain a complete mailing list. The mailing list data base can be changed, sorted, searched, added, deleted and reformatted. There are five types of sort and five types of search. Labels can be printed out on a 40, 80 or 132 character printer and also viewed on the screen for rapid editing. The program accommodates zip codes with seven digits for use outside the U.S.A.

There is a routine for lining up the labels and for setting the spaces between the labels. Provision has also been made to make a backup copy of the data with a single disk drive. The mailing list program makes generation and maintenance of a mailing list very quick and simple.

Price: **\$34.95** for diskette plus **\$1.25** shipping

Includes: User manual and documentation.

723 14th St. N.W.

Calgary, Alberta

Canada

T2N 2A4

Name: **APPLE—DOC**

System: **APPLE II**

Memory: **3.5 to 5.8K** depending on options.

Language: **Applesoft II**

Description: Set of three programs—VARDOC, LINEDOC, and REPLACE.

VARDOC produces a list of every variable used in your program and all the lines each is used on. Screen and/or printer output can include optional descriptors of each variable.

LINEDOC produces a list of every line called by a GOTO, GOSUB, etc, and all the lines each is called from. You are even alerted to calls to lines no longer in the listing. Optional descriptors are for each line number.

REPLACE allows you to easily rename any or all occurrences of any variable in your program. Even change variable types! Can also be used to replace constants or referenced line numbers within the listing. The Literal Mode allows you to replace any set of characters or BASIC statements with any other set. This program is especially useful when appending subroutines with conflicting variable use.

Price: **\$9.95** for cassette, **\$13.95** for diskette.

California residents must add 6 per cent sales tax.

Includes: Three programs plus documentation.

(714) 562-3670, SASE for free information

Name: **Roger's Easel**

System: **Apple II**

Memory: **16K** for Integer and Applesoft ROM, **20K** for Applesoft RAM

Description: Set of three programs: Roger's Easel, Lo-Res Link-Integer, and Lo-Res Link-Applesoft. A paddle oriented sketching program using the color graphics of the APPLE II. The unique features of this set include the ability to store and retrieve user created pictures from tape or disk, ability to erase with a single keystroke, resuming original color when done, and immediate access to a detailed help list while in the program. The most outstanding feature is the option of permanently linking up to 41 pictures to any Integer or Applesoft program for instant recall at any time. Besides being just plain fun, applications range from putting more creative screen images in your game programs to educational programs for younger children involving shape or color recognition.

Price: **\$9.95** on cassette, **\$13.95** on diskette

California residents add 6 per cent sales tax

Includes: Three program set with ten-page manual.

Author: **Roger Wagner**

Available from:

Local APPLE dealers or:
Southwestern Data Systems
P.O. Box 582-MC
Santee, CA 92071
(714) 562-3670

Name: **Programmer's Utility Pack**

System: **APPLE II**

Memory: **4K to 6K** (for the prog. itself) depending on the program used.

Language: **Integer and Applesoft**

Hardware: **APPLE II** with cassette or disk drive

Description: Set of 11 programs. Appends, STR\$() and VAL() are on printed documentation with the tape version. Programs include: Renumber — Integer & Applesoft, Append — Integer and Applesoft, Line Find — Integer and Applesoft, Address/HEX Converter, Screen Find, Memory Move, and the STR\$() and VAL() function simulations for Integer.

By using the various programs one can renumber Integer and Applesoft programs with all GOTO's, etc, being renumbered and the user alerted to unusual situations in the program. These include reference line numbers not in the program, lines referenced by a variable or expression, and a number of others.

Line Find allows the user to locate the actual address range of a line in memory so as to be able to insert CLR, HIMEM:, etc. It can also be used on occasion to recover programs garbaged by dropped bits. Address/HEX Converter converts between the HEX, Integer, and Applesoft address formats. It also provides the two byte breakdown of numbers greater than 256 for use in pointers, etc.

Screen Find is used for printing directly on the screen by POKEing appropriate values into the proper locations in memory. Screen Find gives these values and locations when the characters desired and the horizontal and vertical screen positions are input. Memory Move allows one to move blocks of memory

up or down any number of bytes from Integer or Applesoft. The Monitor has a routine similar to this, but it cannot be used to move blocks up a small distance and it is not possible to use it directly from Applesoft.

STR\$() simulates the function of this name in Applesoft for use in Integer programs. STR\$() in Applesoft converts a number to a string. VAL() is similar but converts strings to numbers.

Copies: **Just Released**

Price: **\$16.95**. Calif. residents add 6 per cent sales tax.

Includes: Two cassettes or one diskette plus documentation.

Author: **Roger Wagner**

Available from:

Local Apple dealers, or:
Southwestern Data Systems
P.O. Box 582-MC
Santee, CA 92071
(714) 562-3670

Name: **Softtouch Utility Pac II**

System: **APPLE II**

Memory: **24K** with DOS

Language: **Integer and Applesoft BASIC**

Hardware: **Disk drive**

Description: Set of nine programs on disk. Programs include: checkbook update to DOS, update electronic index file, auto-write instructions, find hidden control characters, slow/stop list, disk space, listing headers and exec reader. A complete listing is provided for all programs and programming.

Checkbook update rewrites your original checkbook program for use with the disk drive. Routines have been added to change accounts or list bank names with account numbers, etc. Index update rewrites Bob Bishop's electronic index file for complete automation. A printing routine has been added for hard copy.

Auto write appends subroutines to existing programs, converts integer BASIC listings to Applesoft or vice versa. Auto write documentation gives detailed instructions for using the program to patch in lines in any part of a program or delete illegal lines such as 65535, etc. Find hidden control character displays any control character buried in a catalog name or any listing for both integer or Applesoft BASIC. Disk space is written in Applesoft and gives sectors and bytes left on a diskette. No text files are created by the program and operating time is three seconds. Slow/stop list may be loaded in and used continuously after switching disks or languages. Exec reader will read text files for all of the above with the exception of index file.

Price: **\$13.95**

Includes: One diskette plus documentation.

A Warning:

The **MACROTeA**TM
is for Professional
Programmers — and Very
Serious Amateurs — Only

Now: a machine language programming powerhouse for the knowledgeable programmer who wants to extend the PET's capabilities to the maximum. The MacroTeA, the Relocating Macro Text Editor/Assembler from Skyles Electric Works.

The Skyles MacroTeA is a **super powerful text editor**. 26 powerful editing commands. String search and replace capability. Manuscript feature for letters and other text. Text loading and storage on tape or discs. Supports tape drives, discs, CRT, printers and keyboard.

The Skyles MacroTeA is a **relocating machine language assembler with true macro capabilities**. A single name identifies a whole body of lines. You write in big chunks, examine, modify and assemble the complete program. And, when loading, the MacroTeA goes where you want it to go. Macro and conditional assembly support. Automatic line numbering. Labels up to 10 characters long.

The Skyles MacroTeA is an **enhance Monitor**. 11 powerful commands to ease you past the rough spots of program debugging.

The Skyles MacroTeA is a **warm start button**. Over 1700 bytes of protected RAM memory for your object code.

There's no tape loading and no occupying of valuable RAM memory space: The Skyles MacroTeA puts 10K bytes of executable *machine language* code in ROM (from 9800 to BFFF — directly below the BASIC interpreter). 2K bytes of RAM (9000 to 97FF).

Like all Skyles Products for the PET, it's practically **plug in and go**. No tools are needed. And, faster than loading an equivalent size assembler/editor from tape, the MacroTeA is installed permanently.

The Skyles MacroTeA: *13 chips on a single PCB. Operates interfaced with the PET's parallel address and data bus or with the Skyles Memory Connector. (When ordering, indicate if the MacroTeA will interface with a Skyles Memory Expansion System. You can save \$20.) Specifications and engineering are up to the proven Skyles quality standards. Fully warranted for 90 days. And, as with all Skyles products, fully and intelligently documented.*

VISA, Mastercharge orders call (800) 227-8398 (Except Calif.)
California orders please call (415) 494-1210.

Hypocycloids

E.D. Morris
3200 Washington Street
Midland, MI 48640

A modification to John Sherburne's original program plots hypocycloids quite a bit faster, on the OSI, by reducing the number of revolutions required. The technique may be used on any micro.

I had just added the extra 2K of memory to my Ohio Scientific 440 video board to implement the graphics option, and was wondering what to do with those 16,384 dots (128 x 128) staring out from my monitor. I happened to pick up the March 79 issue of MICRO and was intrigued by John Sherburne's article on

plotting hypocycloids. A hypocycloid, if you don't remember, is what you get when one circle rolls inside another as in the "Spirograph" toy. I immediately accepted the challenge that if it can be done on a PET, I could do it better on my micro.

ASSEMBLE LIST

```

```

LABEL FILE 1 = EXTERNAL

```
START = 0400      LOOP = 0402      TBL1 = 040B
TBL2 = 050B
110000,060B,060B
```

The original hypocycloid program suffered greatly from lack of speed since each point was calculated using four trigonometric functions. Approximately 300 points per revolution were required. Even then, some gaps appeared in the resulting pattern. I was able to reduce the number of points calculated per revolution to 30 by drawing straight line segments between calculated points. This makes the resulting curves not quite as smooth, but very acceptable as the accompanying photos illustrate. The number appearing in the lower left cor-

ner indicates the number of revolutions required to complete the figure.

Below is the subprogram I used to fill in the space between calculated points (X1,Y1) and (X2,Y2). A different procedure is used depending whether the slope of the plotted line is nearer the X axis or Y axis. Lines 1060-1065 and 1160-1165 store the bit in memory and are specific to my graphics board. I would be happy to provide a copy of the full program to anyone who is using the OIS 440 board with graphics.

```

To Order PROGRAMMER'S TOOLKIT or MacroTeA —

Custom designed to plug into your PET. So, when ordering, please indicate if your Toolkit:

... will be used with the Skyles Memory Expansion System, or	\$80.00*
... will be used with the ExpandaPet, or Expandmem	\$80.00*
... will be used with the PET 2001-8 alone	\$80.00*
<i>(We furnish connectors to the memory expansion bus and to the second cassette interface.)</i>	
... will be used with the PET 2001-16, -32 (chip only)	\$50.00*
... will be used with Skyles MacroTeA	\$50.00*

Your MacroTeA. Custom designed for your PET. So specify your PET model when ordering. \$395.00*

(Important Savings: If it's to be used with a Skyles Memory Expansion System, the MacroTeA can plug directly into the Skyles connector. **So you save \$20.** The Skyles MacroTeA is only \$375.00 when interfaced with the Skyles Memory Expansion System.)

Send your check or money order to **Skyles Electric Works**. VISA, Mastercharge orders may call (800) 227-8398. (California residents: please phone (415) 494-1210.)

Ten Day Unconditional Money-Back Guarantee on all products sold by Skyles Electric Works, except chip only. California residents: please add 6-6½% California sales tax.

Skyles Electric Works 10301 Stonydale Drive, Cupertino, CA 95014, (408) 735-7891

Is Programming Fun?

Have More Fun,
Make Fewer Errors,
Complete Programs Much
Faster... with the
**BASIC PROGRAMMER'S
ToolKit™**

Now you can modify, polish, simplify, add new features to your PET programs far more quickly while reducing the potential for error. That all adds up to more fun... and the **BASIC Programmer's Toolkit**.

The magic of the Toolkit: 2KB of ROM firmware on a single chip with a collection of machine language programs available to you from the time you turn on your PET to the time you shut it off. No tapes to load or to interfere with any running programs. And the **Programmer's Toolkit** installs in minutes, without tools.

Here are the 10 commands that can be yours instantly and automatically... *guaranteed* to make your BASIC programming a pleasure:

AUTO	RENUMBER	DELETE
HELP	TRACE	STEP
OFF	APPEND	DUMP
FIND		

Every one a powerful command to insure more effective programming. Like the **HELP** command that shows the line on which the error occurs... and the erroneous portion is indicated in reverse video:

```

HELP
500 J = SQR(A*B/C)
READY

```

... Or the **TRACE** command that lets you see the sequence in which your program is being executed in a window in the upper corner of your CRT:

TRACE	#100
READY.	#110
RUN	#150

The **Programmer's Toolkit** is a product of Harry Saal and his associates at Palo Alto ICs.

So, if you really want to be into BASIC programming — and you want to have fun while you're doing it, order your **BASIC Programmer's Toolkit** now. We guarantee you'll be delighted with it.

DAM SYSTEMS by cmc
A complete system of modules to let you computer listen
to the real world.

DAM SYSTEMS PRICE LIST

DAM SYSTEMS components

AIM161 - Analog Input Module 16 8-bit analog inputs - 100 microsecond conversion time - 3 state output - requires one 8-bit computer output port for control and one 8-bit computer input port for data.	\$179.00
POW1 - Power Module Supplies power for one AIM16 module.	\$14.95
ICON - Input Connector For connecting analog inputs to the AIM16 - 20 pin card edge connector - solder eyelets.	\$9.95
OCON - Output Connector For connecting the AIM16 to a computer - 20 pin card edge connector - solder eyelets.	\$9.95
MANMOD1 - Manifold Module Use in place of ICON. Screw terminal barrier strips for connecting joysticks, potentiometers, voltage sources, etc. Eliminates the need for soldering. Plugs into the AIM16.	\$59.95
ANAMAN1 - Analog Manifold Module Use in place of ICON. Connects DAM SYSTEMS SENSORS to the AIM16 without soldering - sensor cables just plug in. Plugs into the AIM16 or the MANMOD1.	TBA
SENSORS Sensors for temperature, pressure, flow, humidity, level, pH, motion, etc.	TBA
COMPUTER INTERFACES For the PET, KIM, TRS-80, etc. Use in place of OCON. Eliminates the need for soldering or special construction.	TBA
PETMOD - PET Interface Module Gives two IEEE ports, one user port and one DAM SYSTEMS interface port. Saves wear and tear on the PET's printed circuit board. Also called the PETSAR.	\$49.95
KIMMOD - KIM Interface Module Gives one application connector port and one DAM SYSTEMS interface port.	\$39.95

CABLE "A" - Interconnect Cables Connects computer interface to AIM16, MANDIS1, XPANDR1, etc.	TBA
CABLE A24 - Interconnect Cable 24 inch cable with interface connector on one end and an OCON equivalent on the other.	\$19.95
MANDIS1 - Manual and Display Module Connects between the AIM16 and the computer interface. Allows manual or computer control of the AIM16. Displays channel number and data.	TBA
GPIB MOD - GPIB (IEEE-488) Interface Allows the DAM SYSTEMS MODULES to be used with the GPIB bus instead of a computer's other I/O ports.	TBA
RS232 MOD - RS232 Interface Module Allows the DAM SYSTEMS MODULES to be used with an RS-232 port or terminal.	TBA
XPANDR1 - Expander Module Allows up to 128 8-bit analog inputs (8 AIM16 Modules) to be connected to one system.	TBA

DAM SYSTEMS sets

AIM16: Starter Set 1 Includes: one AIM161, one POW1, one ICON and one OCON.	\$189.00
AIM161 Starter Set 2 Includes: one AIM161, one POW1, one MANMOD1 and one OCON.	\$239.00
PETSET1a Includes: one PETMOD, one CABLE A24, one AIM161, one POW1 and one MANMOD1.	\$295.00
KIMSET1a Includes: one KIMMOD, one CABLE A24, one AIM161, one POW1 and one MANMOD1.	\$285.00

SYM-1 6532 Programmable Timer

The 6532 interval timer is useful as a backup timekeeper or as a loop controller. It can be accessed in two ways, independent of the interrupt system, and employed to meet a variety of realtime program requirements.

Robert A. Peck
1276 Riesling Terrace
Sunnyvale, CA 94087

In addition to the programmable ports and interval timers located in the 6522s, the SYM-1 has an interval timer in the 6532. The 6532-style device is also used on the KIM-1, and so knowing how to use the SYM timer properly will help in understanding KIM programs and enable the SYM programmer to adapt KIM programs for use on his SYM more easily.

The 6532 timer does not have its IRQ line connected to the IRQ input of the 6502. Therefore, lacking direct access to the interrupt structure, we are unable to get as precise a level of timing as with the onboard 6522s. However, if an extra timer or loop controller is required, the 6532 may prove to be useful.

Before using the timer in the 6532, one must first clear the interrupt flags. Since all of the features we intend to use are part of the write-protected memory, we must first of all allow access to this area. This is accomplished by:

```
20 86 8B JSR ACCESS
```

Then, to clear the interrupt flag (PA7 flag), we will read the interrupt flag register. This may be accomplished by reading any one of four locations: A405, A407, A41D or A41F, typically by executing the instruction:

```
AD 05 A4 LDA INTREG
```

After this instruction is executed, the interrupt flag register will contain "80". This register will be cleared to "00" when we write a value into the timer register. We may then go back occasionally during program execution, test to see if the flag register is still zero, and branch if it is not zero.

As another alternative, we can do a BIT test on the flag location, checking only the timer flag for the branch condition. This method has been used in the sample program. If the BIT test is used, it is not necessary to read the interrupt register in order to clear the PA7 flag because this flag will not be tested. The initial read instruction then becomes redundant.

At this point, we must decide how many clock cycles are to elapse before the timer flag becomes set. Then we will write the selected value into the counter.

There are four different points at which to enter data into the counter, A41C, A41D, A41E and A41F. These are indicated in the manual as 1T, 8T, 64T and 1024T. These multiples mean that any data which is entered into the counter will begin at that particular count and decrement at the rate of the clock frequency (1T), or at one decrement for each eight clock cycles (8T), one decrement for each 64 clock cycles (64T) or one decrement for each 1024 clock cycles (1024T).

There is only one timer register, but the four addresses mentioned above are the means by which the frequency pre-divider is set. For example, if we write "01" into location A41E, the timer flag is reset and, 64 clock cycles later, the timer flag is set again. If we write "01" into location A41F, instead, then the timer flag will not be reset until 1024 clock cycles have elapsed.

Just as an example, let's say we wanted 800 clock cycles to elapse before the timer flag is set. We will be reading the flag register periodically to see if it is non-zero, determine whether the flag gets set, and branch on the non-zero condition. Writing decimal 00 (hex 64) into location A41D sets the pre-divider; to 8 then, $8 \times 100 = 800$ ticks later, the timer reaches zero and the flag is set.

While the counter is independently decrementing, we can determine the current timer contents at any time by reading one of these four locations: A404, A406, A41C, A41E. There are four readable locations due to "don't care" addressing modes or incomplete address decoding.

One might be tempted to look at the timer contents, occasionally, and branch when the count reaches zero. This does not offer a good chance for success as the following example will show.

Let's say we've written "0A" (decimal 10) into location A41D (8T) so that 80 cycles later the timer will count down to zero. Suppose we do the following during the counting period:

- (A) Increment a memory location
- (B) Test timer contents
- (C) Branch back if non-zero

If the sequence of operations takes seven machine cycles, then after 77 cycles the timer will still be at "01" and after $77 + 7 = 84$ cycles the timer will contain a count of zero since more than 80 cycles have elapsed, right? Wrong! Unfortunately, it will contain "FC" instead! The limitation of this counter is that, as soon as zero is reached and the flag is set, the counter continues to decrement, but it no longer matters which counter multiple was being used because as the counter immediately begins to free-run decrement at the 1T rate.

To overcome this limitation, since we do not use the IRQ and since we only sample occasionally, we will generally read the interrupt register, testing for a non-zero figure, rather than reading the timer and looking for zero contents as shown above.

Now we come to an example program which ties everything together and demonstrates the use of this timer. Location 20D may be set for any desired timer value. Location 20F may be set to 1C, 1D, 12E, or 1F depending upon whether you want to operate the timer with a predivide of 1T, 8T, 64T, or 1024T. You will notice that the loop of instructions between locations 211 and 224 takes a total of 28 machine cycles to execute.

Begin program execution at location 200. The display will light, upon completion indicating how many times the program was able to traverse the loop before the timer flag became set.

Letters

Having trouble running mnemonically-entered programs on your AIM-65? This might be one source of the problem.

According to the AIM-65 User's Guide, indirect indexed addressing mode may be entered by using either "(HH,Y" or "(HH)Y" where "HH" is a hexadecimal byte. The AIM-65 Summary Card lists the alternatives "(HH,Y" or "(HH,Y)".

However, only the format "(HH)Y" will assemble correctly.

The formats (HH,Y and (HH,r) will be assembled incorrectly as indexed indirect instructions. "(HH,X)".

More LETTERS

I have a SYM-1. While debugging a program that uses the timer in the 6532 I found out that the IRQ pin is not connected to the IRQ bus. Rather than spend a lot of time finding the neatest way to connect the 6532 IRQ pin to the IRQ bus, I simply ran a piece of wire wrap stock between the IRQ pin on the 6532 to the nearby 6522. Now I can use the interrupt feature of the 6532. I do not know whether Synertek did this for a particular reason but I have not had any problems since making this little modification. Perhaps you are already aware of this. I just thought I would pass it along, for what it is worth.

Keith Le Baron
1260 S. Blackhawk
Freeport, IL 61032

There is a useful, but unadvertised, display subroutine in the AIM-65 Monitor. It is labeled OUTDD1, and can be called by a JSR instruction to hex address EF7B.

The subroutine displays the ASCII character which is in the accumulator, at the relative position (0 - 19 decimal, or 0 - 13 hexadecimal) indicated by the X register. It returns with A and X contents intact.

Before calling the subroutine, be sure to ORA #80, or else the hardware cursor will be displayed.

Don Stein
6012 Chatsworth Lane
Bethesda, MD 20014

[Editor's Note: Marvin De Jong demonstrated the use of this subroutine in an earlier issue of MICRO. Since, however, Don Stein independently "found" it and thinks that it is important enough to point out to other AIM users, we are printing his letter.]

[Editor's Note: If you have some small bit (byte?) of information that you wish to pass on to fellow computerists, a short letter to MICRO is one simple way to "pass the word along".]

Put Yourself in Control with the APPLETHROTTLE

That's right! The APPLETHROTTLE will turn your game paddles into a speed controller. By simply pushing a button, you can stop your computer for as long as you want. Release the button, and your computer enters a slow-motion mode with one paddle controlling the speed. And if that isn't enough, look at these additional features:

- Plug into any slot
- Works with machine language, Integer BASIC, and Applesoft
- Normal - slow - stop
- Use to LIST, TRACE, RUN, etc.
- NO SOFTWARE to load
- Unveil program secrets

APPLETHROTTLE \$89.95

And there's more! No more multiple LIST commands to view small program sections. With the APPLETHROTTLE, you'll be able to list or trace long programs while watching your program flow in slow-motion. So get in control with the APPLETHROTTLE and order yours today!

APPL!TIME, a Real Time Clock for the Apple II. Plugs directly into any slot and keeps time even when computer is off. Features 12/24 Hour, ECD/ASCII data format, and AC/Crystal time base selection. Includes software examples for machine language and BASIC programs. Completely assembled and tested.
APT-1 Real Time Clock **\$79.95**

PROTOBOARD, with over 1300 holes on 0.1 centers for designing your own circuits.

APB-1 Protoboard **\$17.95**

VERBATIM 5 1/4" DISKETTES
Soft-Sector Box of 10 ... **\$34.50**
(plastic file case included)

ADVENTURE

GAMES OF HIGH ADVENTURE
FOR THE APPLE II FROM

SYNERGISTIC SOFTWARE

5221 120th Ave. S.E.
Bellevue, WA 98006

The Adventure games combine the exciting graphics and sound effects capabilities of the APPLE II with the fascinating complexity of a mythical adventure game. Monsters, hazards, obstacles, weapons, magical devices and evil powers confront the player at every turn as you gather treasure and try to reach your goal. Two adventures are now available:

DUNGEON CAMPAIGN - Full color graphics
subterranean adventure. 16K required.
CASS. \$12.50 DISK \$15.00

WILDERNESS CAMPAIGN - HIRES graphics
surface adventure. 48K required.
CASS. \$15.00 DISK \$17.50

GET BOTH ON ONE DISK FOR \$30.00

(WA Res. add 5.3% sales tax)

A Real-Time Clock for OSI Disk Systems

Did you know that your OSI disk-based system has most of the hardware you need for a realtime clock already built in? Here is information on how to use it.

Robert T. Kintz
104 Council Rock Avenue
Rochester, NY 14610

For most personal and business applications, the need for keeping track of time is either not very great or can be handled by special software routines for particular applications. Where microcomputers are involved in process control operations, however, such as in the real-time control of laboratory experiments, precise timekeeping is a must. Here the initiation and sequencing of most computer-controlled events must be held in tight lock-step with a real time clock.

Owners of Ohio Scientific Challenger II and III disk-based systems may not be aware that provision for a real-time clock already exists on their 470 disk controller board. The bottom middle section

of this board contains the PC foils to mount three 74390 decade counter IC's. These divide the on-board 1 MHz crystal clock to provide pulses ranging from 1 to 100,000 per second, selectable at the user's option.

Timing pulses may be fed into the NMI or IRQ lines of the OSI bus (pins 2 or 3) where the 6502 will see them as interrupt signals. The software to handle an interrupt-driven, time keeping routine must have been loaded into memory prior to turning the clock on, or it may be permanently located in PROM at a convenient memory address.

One example of how the hardware may be implemented is shown in Figure 1. A 0.1 Hz clock pulse from the third

74390 is fed into both inputs of a two-input nand gate (7400) after passing through a switch located on the front panel. The 7400 may be conveniently located in the prototyping area just below the three 74390's on the 470 board.

The second input to the two nand gates is taken from bit "0" of a 6821 PIA located on the 500 or 510 CPU board. The outputs of the two 7400 gates are fed to the NMI bus line and a front panel LED, respectively. The brightly flashing LED serves as a reminder that the clock is running, following turning the switch "on" and setting bit "0" high.

The actual interrupt handling and clock routines have been written in machine language, as shown, where they have been assembled to start at \$6900 (26880). Of course, relocation of these routines, as well as the clock counters, is entirely optional. Be sure, however, that they are located above the workspace occupied by BASIC or other applications programs.

A BASIC demonstration program incorporating the clock is also shown. Lines 50-70 set up the PIA on the CPU board (63232) so that ports A and B are configured as inputs and outputs, respectively. Since OSI's PROM monitor vectors to \$0130 on receipt of an NMI interrupt, lines 90-100 POKE a jump to the start of the interrupt handling routine.

Next, in lines 120-140, the machine language object code is read as data and POKEd into high memory. The decimal equivalents of the object code are represented as DATA in lines 9010-9110. Lines 200-220 now set the clock counter locations to "0" and we are ready to turn the clock switch "ON".

Once this is accomplished, the clock is under program and/or keyboard control via POKEs to the PIA PORT B, bit "0." Applications programs inserted at line 300 may use the clock by PEEKing at the appropriate clock counter locations.

Figure 1

Akron, OH 44320

478. The Cider Press 2 No. 1 (April, 1979)

- Scribblemonger, John, "FORTH, Ver 1.6", pg. 1.
Forth for the APPLE is 20 times faster than BASIC.
- Silverman, Ken, "Computer Terms", pg. 2.
APPLE terms defined and explained.
- Nareff, Max J., "Max your APPLE", pg. 2.
Another in a series of articles designed to simulate the various MATriX functions on the APPLE.
- Larsen, Leroy W., "Still another BSTAT", pg. 2.
This BSTAT offers choice of hex or decimal and gives you CATALOG so you can enter the name of the program exactly with the cursor and save the program with another cursor move on the APPLE.
- Bernard, Phil, "Storing Strings on Tape, or, Is Disk Necessary?", pg. 3.
- Anon, "Disk of the Month", pg. 3.
Twenty-five programs on disk.
- Vrooman, Gerry, "The APPLE II Memory Map De-Fogger", pg. 4.
Explanation of where various functions are in memory.
- Rahl, Robert R., "N-N-N-N-N-N-N-N", pg. 6.
Another version of the Hello program for the APPLE disk combining a few new gimmicks.

479. Byte 4 No 4 (April, 1979)

- Campbell, Richard, "Cross Pollinating the APPLE II", pgs. 20-25.
A serial I/O port based on an Intel 8251 with RS-232 output.
- Zimmerman, Mark, "Simulating Physical Systems — The Two-Dimensional Ideal Gas", pgs. 26-41.
Use your PET to experiment with physical models.
- Meushaw, Robert V., "The Standard Data Encryption Algorithm", pgs. 110-126.
Using the KIM-1 in encryption.

480. KB Microcomputing (formerly Kilobaud) No 29 (May, 1979)

- Lindsay, Len, "PET-Pourri", pgs. 6-7.
New PET versions of the Microtechnology Unlimited KIM music board and visible memory are in the offing. More on tape head alignment on the PET. A TAPE TEST program from Jim Butterfield is listed.
- Anon., "OSI Small Systems Journal", pgs. 8-11.
The OSI Small Systems Journal is now published as a section of Microcomputing.
- Anon., "New Products", pgs. 14-25.
A new control board for PET, An ADC Adapter module for PET, and Superchip for the APPLE.
- Knox, Thomas; Brazil, Ray H.; and Richardson, Robert M.
"Letters to the Editor", pgs. 23-24.

Letters discuss advantages and disadvantages of APPLE II and TRS-80.

- Pepper, Clement S., "KIMCTR", pgs. 34-38.
This KIM-1 frequency counter/timer can be used with any micro with comparable features.

481. Southeastern Software Newsletter No 8 (April 1979)

- McClelland, Geo., "A Fast Circle Drawing Program", pg. 2.
On the APPLE Use \$FDOC, RDKEY. With several examples, a good tutorial. Also explains exclusive OR.
- McClelland, Geo., "Program to Print Applesoft Tokens", pg. 4.
Listing of a program to supplement an earlier program to print Integer BASIC tokens.
- McClelland, Geo., "Searching for a Small String Embodied in a Larger String", pg. 5.
Simple listing to use with files or data statements, etc.
- McClelland, Geo., "Running Disk Programs the Easy Way", pg. 6.
Use of the cursor makes reading in those program titles easy.

482. 6502 User Notes No 14 (April 1979)

- Zuber, Jim, "KIM-1 Banner", pgs. 1-9.
Designed for a 40-column printer.
- Larrabee, Robert D., "Check-Out", pgs. 9-14.
How to check out a new program on the KIM without having to continually hit the plus key. Back up feature. And ability to ADD some material in the middle of a program.
- Schilling, Heinz Joachim, "BASIC Mod and Programming Hirt", pg. 12.
A modification to correct a problem of reloading programs on the KIM using Microsoft BASIC.
- Grabowsky, Dick, "BASIC Output Paging Mod", pgs. 12-13.
How to limit program listing to 16 lines at a time on the KIM using Microsoft BASIC.
- McKenna, Sean, "Automatic Line Number Entry Prompt for BASIC", pg. 13.
An automatic line numbering input routine for 9-digit KIM BASIC.
- Herman, Harvey, "Renumber Addendum and Some Mods", pg. 13.
Hints for KIM Microsoft BASIC.
- Grabowsky, Dick, "A New Command for BASIC", pg. 15.
Implementing the GET command in KIM BASIC.
- Anon., "Computer Language Forum", pg. 17.
Notes and discussions of FOCAL, Tiny BASIC, FORTH and XPLO.

Mackay, A.M., "Accessing the SYM Displays", pg. 18.

A program to output characters on the display.

Kingston, C., "SYM Notes and KIM-4 Compatibility", pg. 18.
Interfacing details for these two units.

Adams, Jim, "Wumpus and Music Box for SYM", pg. 20.
Modifications to implement these two programs on the SYM.

Nelis, Jody, "Manual Corrections", pgs. 20-23.
Corrections for the AIM User's Manual.

Merhar, Milan, "TVT-6 Notes and RAM Expansion", pgs. 24-25.
TVT-6 discussion and a way to fill the lower 4K in KIM.

McCormack, Chris, "Cassette Directory Printout Program", pgs. 25-26.
Prints your tape directory on your TTY or terminal.

483. Stems from Apple 2 No 4 (April, 1979)

Gustafson, Gus, "INT/FP Stop List Program", pg. 4.
BASIC programs for Stop List.

Gustafson, Gus, "Apple Disk Copy Program", pg. 5.
Modified program to permit using two cards and multiple drives.

Sittel, Randy, "Program FRE(0)", pg. 5.
Routines for free bytes no matter what the memory.

484. Circuit News, April 15, 1979

Anon., "Microcomputers Monitor Oil Well Operation"
APPLE II is used in monitoring off shore oil well drilling processes, displaying information continuously on a silent 700 printer and an H-P X-Y plotter.

485. The Pet Gazette, Spring, 1979

Anon., "Beautiful Music", pg 1, 21.
Micro Technology Unlimited is coming out with a PET version of the KIM music board (DAC) and the visible memory.

Butterfield, Jim, "Routines from PET BASIC", pgs. 2-6.
A listing of a large number of routines from PET BASIC.

Anon., "PET Tokens", pg. 8.
A listing of the 255 PET Tokens.

Butterfield, Jim, "Thoughts on PET BASIC", pgs. 10-12.
Hints for PET users, GET statements, the PET timer, precautions for amateur mechanics, print suppression, etc.

Sherman, H., "Machine Language Load Program", pg. 14.
A BASIC program which loads a machine language routine into the PET.

Anon., "Trace", pg. 18.
A machine language program for tracing the progress of a BASIC program.

Strasma, Jim, "Installing a Second Keyboard", pgs. 20-21.
Instructions and discussion of the keyboard installation.

Butterfield, Jim, "Unlist-List Protection", pg. 21.
How to protect your program listing.

Albrecht, Bob and Karl, "PET BASIC for Parents and Teachers", pgs. 24-25.
Part 6 of this continuing tutorial.

Butterfield, Jim, "PET Memory Locations", pgs. 26-28.
Listing of a large number of key locations and functions.

Butterfield, Jim, "Tape Head Alignment", pg 32.
Procedure and program listing of a tape test to help solve this important problem.

486. Design News, April 23, 1979

Stefanides, E.J., "Personal Computers Become Tool of the Average Man", pgs. 42-48.

487. Byte 4 No 5 (May, 1979)

Pfeiffer, Erich A., "Aids for Hand Assembling Programs", pgs. 238-244.

The article's assembly method is used for program development on a KIM-1 microcomputer.

488. Southeastern Software Newsletter Issue No 9 (May, 1979)

Hartley, Tim, "Stop-List", pg. 1.
Stop-List which works with Applesoft.

Hartley, Tim, and McClelland, Geo., "Character Set", pg. 2.
A machine code program to print the entire character set. Also a discussion of how the program works and the use of the disassembler.

Anon., "Applesoft II Merge Program", pg. 3.
For disk or tape versions or ROM version AS II.

Hartley, Tim, "Hi-Res Drawing Program", pgs. 4-5.
Written for a disk system with the AS II ROM card but mcmds are given to change it for use on other combinations.

Anon., "Correcting Disk Files", pgs. 5-7
An addition to the NAMES FILES program given in earlier issues.

489. MICRO No. 12 (May, 1979)

Burnett, Joe, "An AIM 65 User's Notes", pgs. 5-7.
Notes on getting started with the AIM 65.

Carpenter, Chuck, "S-C Assembler II — Super APPLE II Assembler", pgs 9-11.
Machine or assembly language coding is as easy as BASIC with this assembler.

Donaio, Joseph, "A PET Hex Dump Program", pgs. 13-15.
Now you can look at your BASIC in ROM or other interesting codes in machine language.

Gieryc, Jack, "Super HI-LO for the SYM-1", pgs. 17-22.
HI-LO with a new twist to the game.

Williams, J.C., "A 100 us 16-Channel Analog-to-Digital Converter for 65XX Microcomputer Systems", pg. 25-29.
How real-time games can be written for the OSI Challenger systems which use a serial terminal run from the ACIA.

Tripp, Robert M., "ASK the Doctor — Part IV. Good News, Bad News", pgs 35-36.
Good news is that only two minor hardware changes improve the high-speed cassette read/write. The KIM read routine is also improved, new uses for the BREAK command are given, and now the register name is displayed during the R command.

Rowe, Mike (Staff), "The MICRO Software Catalog: VIII", pgs. 37-38.
Eleven new programs are described.

Doutré, Ben, "Inside the KIM TTY Service", pgs. 39-40.
How to operate the KIM TTY link at 9600 baud.

Kirschner, Frank D., "The Integer BASIC Token System in the APPLE II", pgs. 41-43.
How APPLE stores characters. A meaty article showing how to exercise considerably more control over the BASIC interpreter in your microcomputer.

Carpenter, Chuck, "Renummer Applesoft", pgs. 45-46.
Append and renumber routines.

Anon., "Classified Index for Issues 7 to 12", pgs. 47-48.
Index is broken down by system — APPLE, OSI, General, KIMTIM, SYM/AIM, and so on.

490. 73 Magazine No 12 (May, 1979)

Schmidt, Bill and Shattuck, Bob, "RTTY Transceiver for the KIM-1", pgs. 78-82.
This program requires a video terminal and AFSK generator.

Introducing SEAWELL's

Little Buffered Mother

The ultimate Motherboard for any KIM-1, SYM-1, or AIM-65 system

Features:

- 4K Static RAM on board
- +5V, +12V, and -12V regulators on board
- 4 + 1 buffered expansion slots
- Accepts KIM-4 compatible boards
- Full access to application & expansion connector
- LED indicators for IRQ, NMI, and power-on
- Also compatible with SEA-1, SEA-16, the PROMMER, SEA-PROTO, SEA-ISDC, and more
- Onboard hardware for optional use of (128K addressing limit)
- Mounts like KIM-4 or with CPU board standing up
- 10 slot Motherboard expansion available - SEAWELL's Maxi Mother

Standard. \$139

w/4K RAM. \$189

Assembled Only

products for the APPLE II

APPLESOFT II UTILITY

(Diskette Only) \$12.45

The Applesoft II Utility program provides the user with the following features. a) Complete automatic renumbering of any Applesoft II program. b) The creation of an EXEC File for subroutine file creation. This feature allows you to incorporate the same subroutine in various programs. c) No modification of the program in machine memory (RAM). d) Automatic running of the program. No programmer should be without this excellent utility program. REQUIREMENTS: Disk II, Applesoft II, 16K of memory.

REAL ESTATE ANALYSIS PROGRAM

\$14.95

The Real Estate Analysis Program provides the user with three features. a) A powerful real estate investment analysis for buy/sell decisions and time to hold decisions for optimal rental/commercial investments. b) Generation of complete amortization schedules consistent with banking practices and schedules. c) Generation of depreciation schedules for selecting the best depreciation schedule for your use and a determination of optimal switch over points to straight line to maximize depreciation. All three features are designed for video screen or printer output. In addition, the program will plot; cash flow before taxes vs. years, cash flow after taxes vs. years, adjusted basis vs. years, capital gains vs. years, pre-tax proceeds vs. years, post-tax proceeds vs. years, and return on investment (%) vs. years. REQUIREMENTS: Applesoft II, 16K of memory without DOS or 32K of memory with DOS (Disk II).

ADDRESS FILE GENERATOR

\$19.95

A professional piece of software which allows the user to create four different types of address files: a) Holiday File, b) Birthday File, c) Home Address File, and d) Commercial Address File. The program contains a menu of seven major commands: 1) Create a File, 2) Add to File, 3) Edit File, 4) Display File, 5) Search File, 6) Sort File, and 7) Reorganize File. Most of the major commands have subordinate commands which adds to the flexibility of this powerful software system. We doubt you could buy a better program for maintaining and printing address files. REQUIREMENTS: Disk II, Apple Printer Card, 32K of memory with Applesoft ROM Card or 48K of memory without Applesoft ROM Card.

SUPER CHECKBOOK

\$19.95

A totally new checkbook program with a unique option . . . Bar Graphs. These bar graphs, outputted to a printer or video screen, provide trend analysis data on code expense, income, expenses, or gain/loss on a month by month basis. The program contains a total of fourteen options: 1) Check/Deposit Entry & Modification, 2) Reconciliation of Checks or Deposits, 3) Sort by Check Number, 4) Sort by Code for Year, 5) Sort by Code for Month, 6) Output Year to Date, 7) Output Month Activity, 8-11) Printer/Video Plot Trend Analysis-Bar Graphs, 12) Account Status, 13) Reconciled Check Status, and 14) Quit. An excellent program for maintaining your checkbook, or that of a small business. REQUIREMENTS: Disk II, 32K of memory with Applesoft ROM Card or 48K of memory without Applesoft ROM Card.

FUNCTION GRAPHS AND TRANSFORMATIONS

\$14.95

This program uses the Apple II high resolution graphics capabilities to draw detailed graphs of mathematical functions which the user defines in Basic syntax. The graphs appear in a large rectangle whose edges are X and Y scales (with values labeled by up to 6 digits). Graphs can be superimposed, erased, drawn as dashed (rather than solid) curves, and transformed. The transformations available are reflection about an axis, stretching or compressing (change of scale), and sliding (translation). The user can alternate between the graphic display and a text display which lists the available commands and the more recent interactions between user and program. Expected users are engineers, mathematicians, and researchers in the natural and social sciences; in addition, teachers and students can use the program to approach topics in (for example) algebra, trigonometry, and analytic geometry in a visual, intuitive, and experimental way which complements the traditional, primarily symbolic orientation. REQUIREMENTS: 16K of memory with Applesoft ROM Card or 32K of memory without Applesoft ROM Card.

the pet program.

1

GRAPHICS PAC 2

New Version

Quadruple your PET's graphic resolution. Why be stuck with the PET's cumbersome 25 x 40 1000 point display. With Graphics Pac you can directly control (set and clear) 4000 points on screen. It's great for *grapting, plotting, and gaming*. Graphics Pac allows you to plot in any combination of two modes: 1 Quadrant graphing with (0,0) center screen, and Standard graphing with (0,0) plotted in the upper left hand corner. Complete documentation shows how you can *merge* this useful routine with any of your own programs *without retyping* either one! All this on a high quality Microsette for only \$9.95.

2

ASSEMBLER 2001

A full featured assembler for your PET microcomputer that follows the *standard set of 6502 mnemonics*. Now you can take full advantage of the computing abilities of your PET. *Store and load via tape, run through the SYS or USR functions. List and edit* too with this powerful assembler. No other commercial PET assembler gives you all these features plus the ability to look at the *PET'S secret Basic ROMs all in one program*. This valuable program is offered at \$15.95

3

BIKE

An exciting new simulation that puts you in charge of a bicycle manufacturing empire. Juggle inflation, breakdowns, seasonal sales variations, inventory, workers, prices, machines, and ad campaigns to keep your enterprise in the black. *Bike is dangerously addictive*. Once you start a game you will not want to stop. To allow you to take short rest breaks, Bike lets you store the data from your game on a tape so you can continue where you left off next time you wish to play. Worth a million in fun, we'll offer BIKE at \$9.95.

4

PINBALL

Dynamic usage of the PET's graphics features when combined with the fun of the *number 1 arcade game* equals an *action packed video spectacle* for your computer. Bumpers, chutes, flippers, free balls, gates, a jackpot, and a little luck guarantee a great game for all. \$9.95.
